

# 2011 Seasonal Prediction for Canada

Kerry Anderson

# Canadian FWI System

Physical Property	FWI	FBP	US
0-2 cm	FFMC	-	10 hour moisture
2-5 cm	DMC	-	100 hour
5+ mc	DC	-	1000 hour KBDI
Propogation speed ( r)	ISI	ROS [m/min]	SC or BI
Depth of Burn (w)	BUI	TFC [kg/m <sup>2</sup> ]	?
Fire intensity (I=Hwr)	FWI	HFI [kW/m]	ERC

# Methodology

1. Calculate spring start-up conditions based on fall drought code (DC) values and over-winter precipitation amounts,
2. Calculate average daily weather for weather stations across country,
3. Incorporate Environment Canada's seasonal predictions,
4. Determine the fire severity based on the ratio of forecasted over average seasonal severity rating (SSR).

# Ensemble Forecasts

Recently, the Canadian Meteorological Centre (CMC) of Environment Canada has begun providing temperature and precipitation probabilistic forecasts based on an ensemble of ten integrations of four independent models:

1. climate ver. of the **Global Environmental Multiscale** model (GEM-CLIM),
2. 2nd gen. of the **Atmospheric General Circulation Model** (AGCM2),
3. 3rd gen. of the **Atmospheric General Circulation Model** (AGCM3),
4. **Spectral aux éléments finis** (SEF).

Forecasts are provided for the next four months.

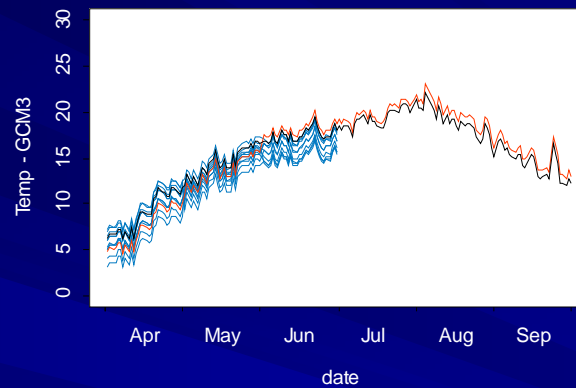

# Ensemble Forecasts

CYEG

CYEG

CYEG

CYEG

The ensemble approach provides a measure of confidence indicated by the spread of the ensemble members.

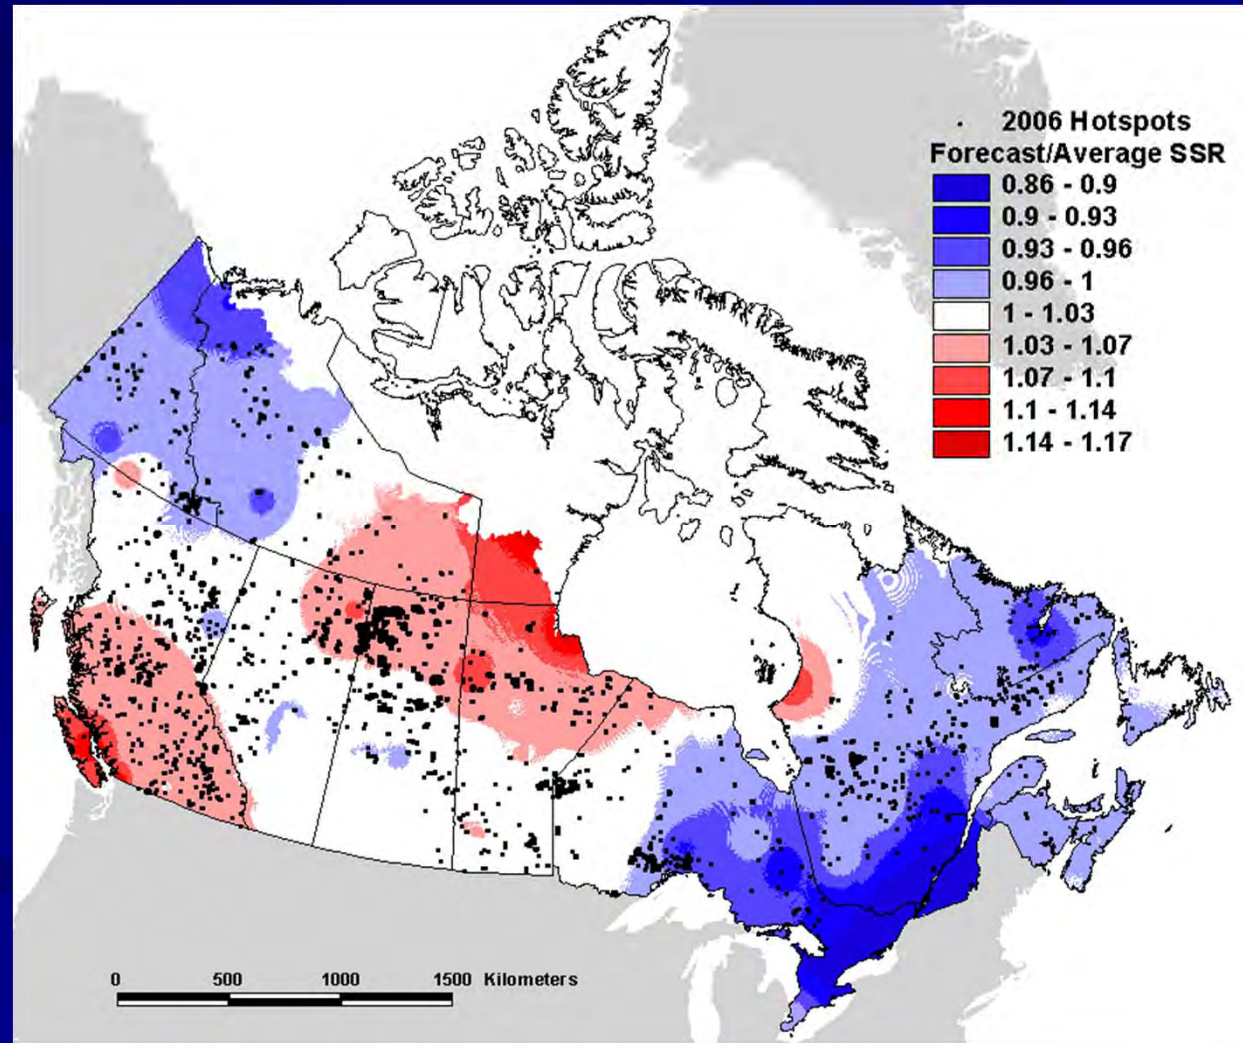

The extended forecast continues to use the single, deterministic forecast

# Past Predictions

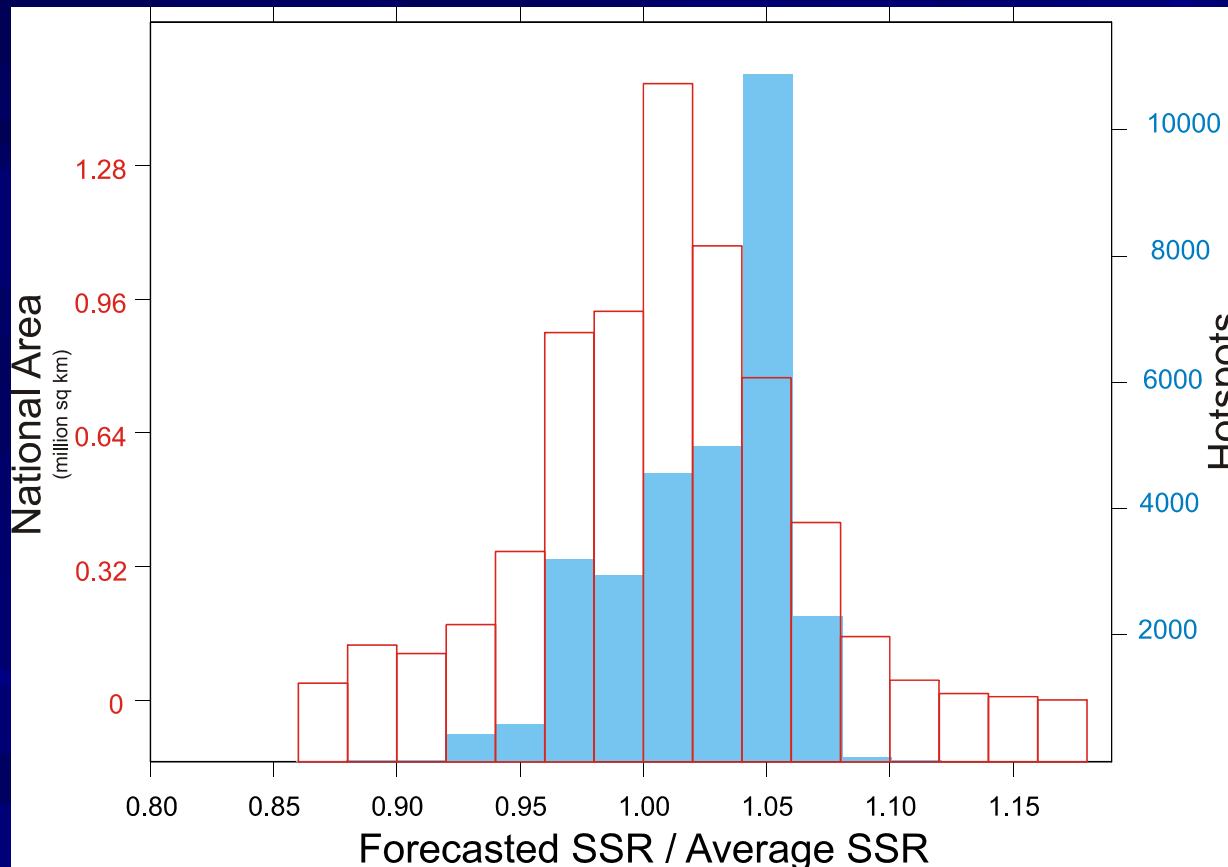

# 2006 Prediction

Using hotspots to assess the seasonal outlook, the forecast was good for Southern BC, the Northern Prairies and western Quebec.

On the other hand, the forecast was marginal for the Southern Yukon and central Alberta and poor for central Ontario, central Quebec and Labrador.

# 2006 Prediction

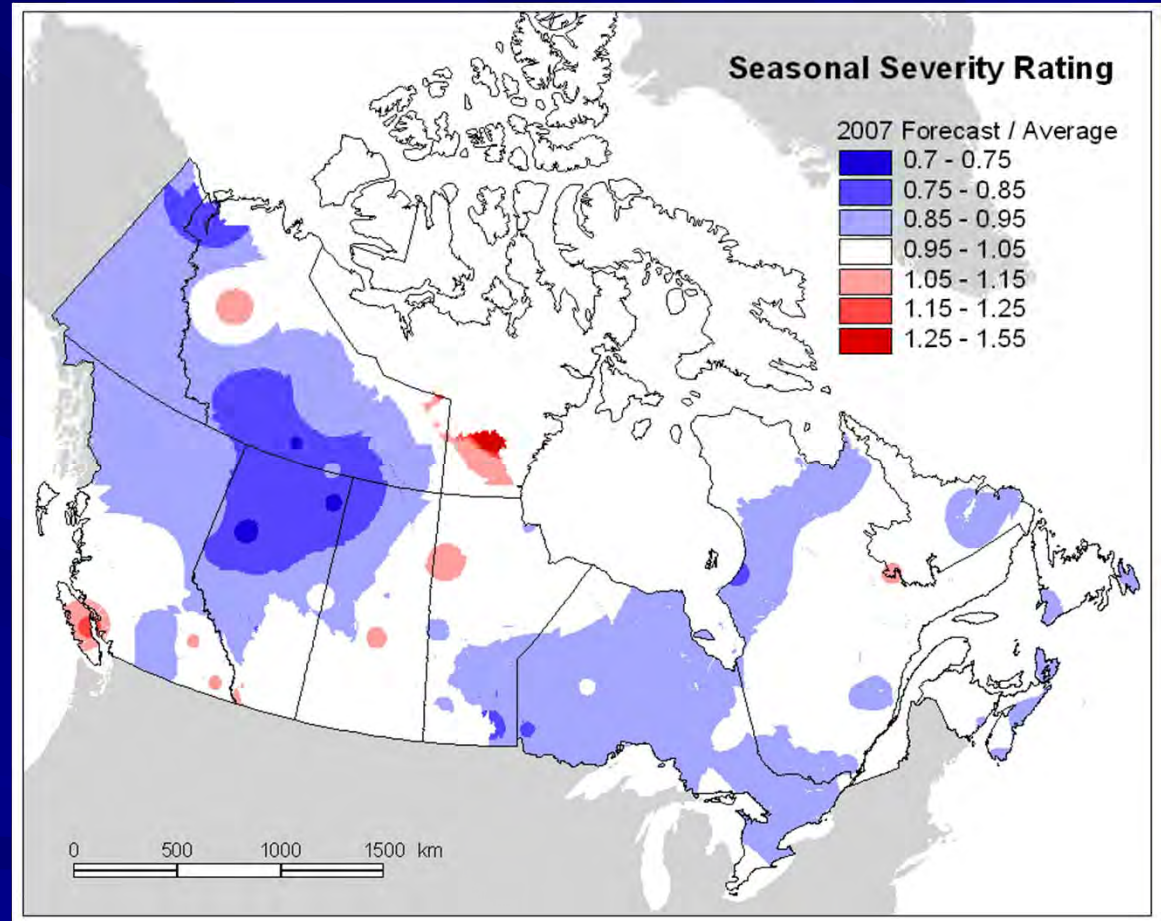

Comparing the distribution of the forecasted over average SSR values for all of Canada (area within each prediction value) and for hotspot locations shows that the seasonal forecast had skill at predicting fires for most of Canada.

# 2007 Prediction

The 2007 prediction showed below-average conditions throughout much of Canada.

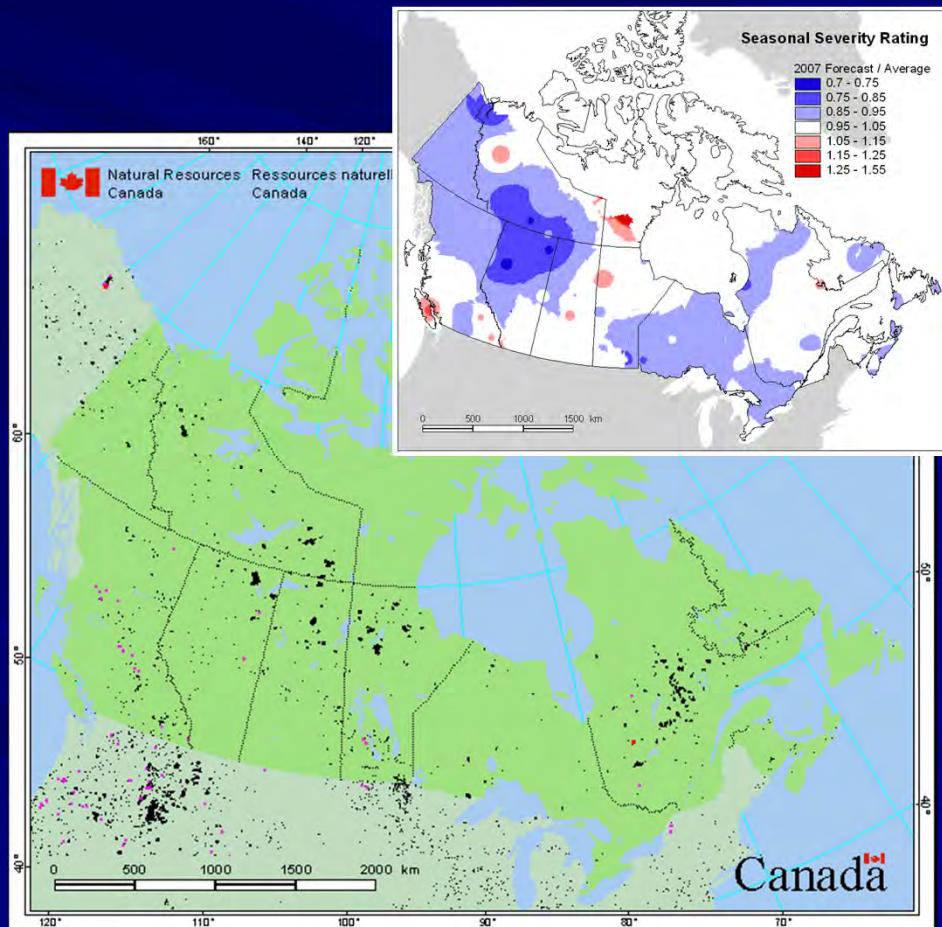

Only Vancouver Island, central Saskatchewan and northern Manitoba show above-average severity.

# 2007 Prediction

As it turned out, 2007 was a quiet fire season with fire activity limited to Quebec, Southeastern BC, and the northern boreal plains.

HECTARES by YEAR

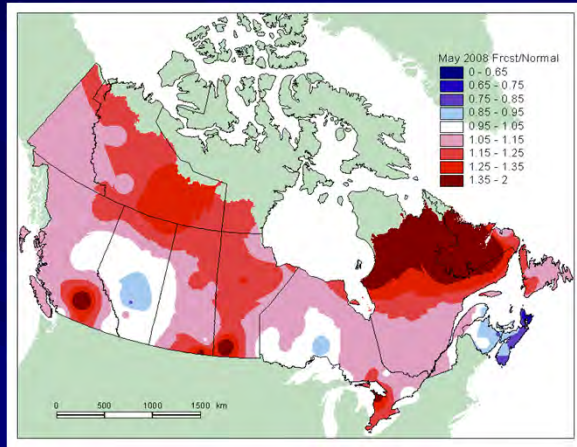

FIRES by YEAR

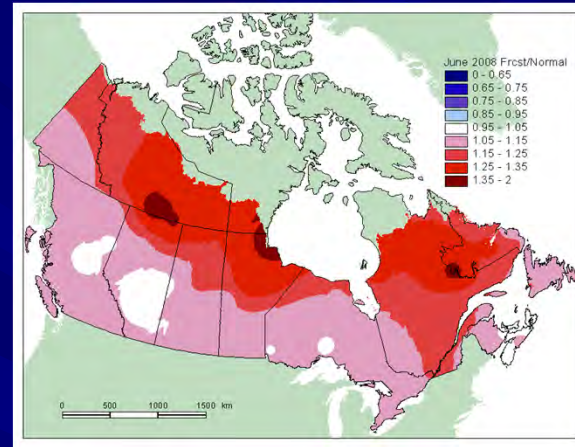

# 2008 Prediction

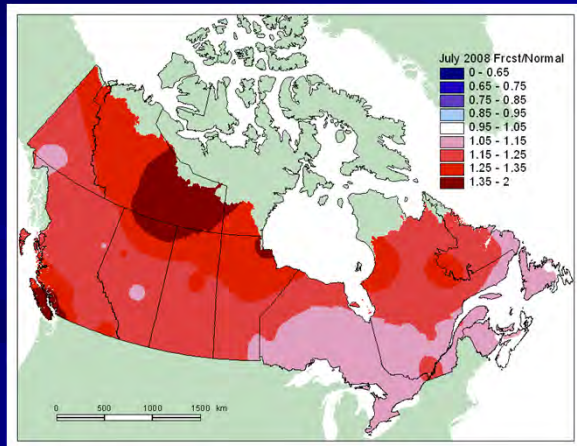

May

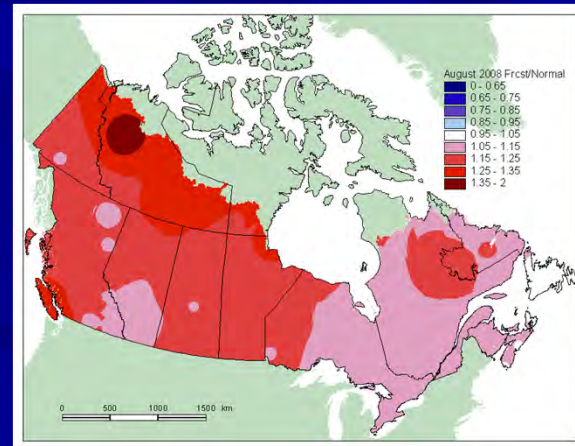

June

July

August

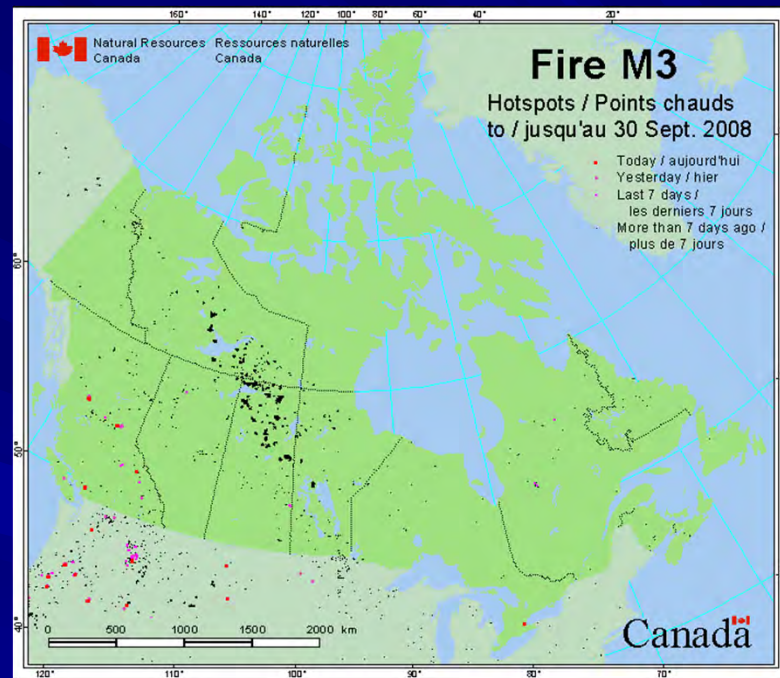

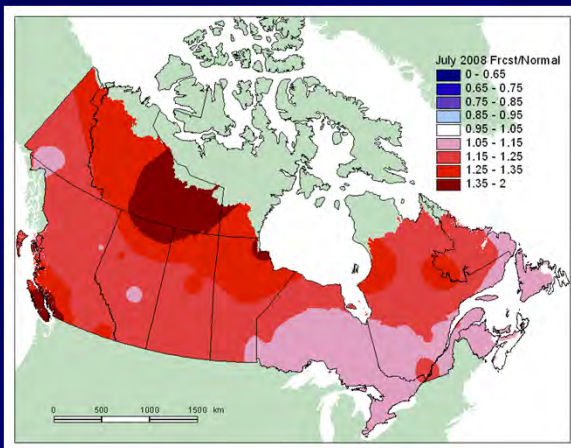

For 2008, monthly predictions indicated an above-average year for most of Canada.

# 2008 Prediction

2008 turned out to be a quiet fire seasons with only 1.49 million ha burned (10 year average is 7 million ha).

July

**HECTARES**  
2008 vs 10 YEAR AVG.

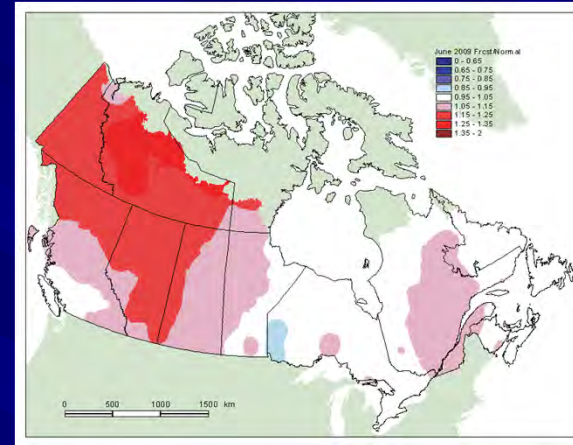

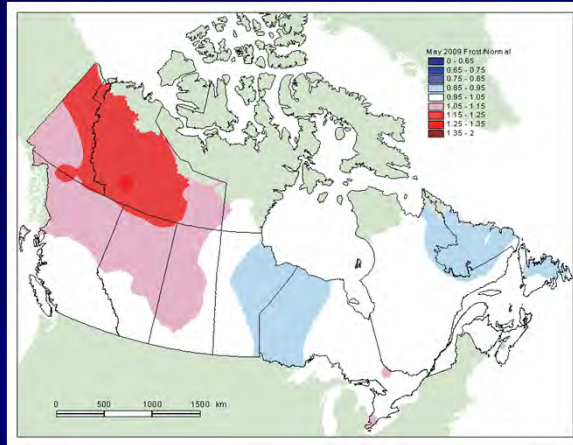

Most of the fire activity (95%) occurred in Saskatchewan and NWT (mainly in July) suggesting that while we over-predicted the severity of the fire season, we correctly predicted the region of peak fire activity.

# 2009 Prediction

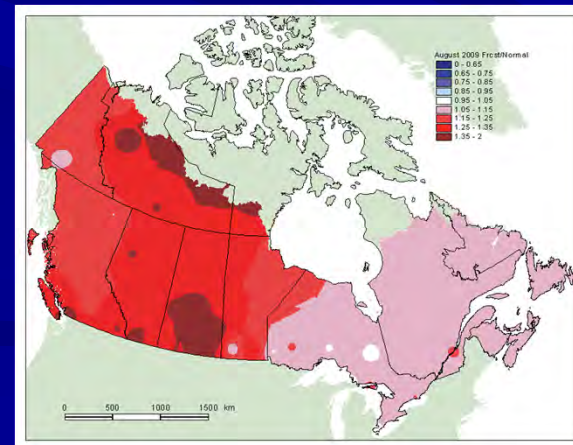

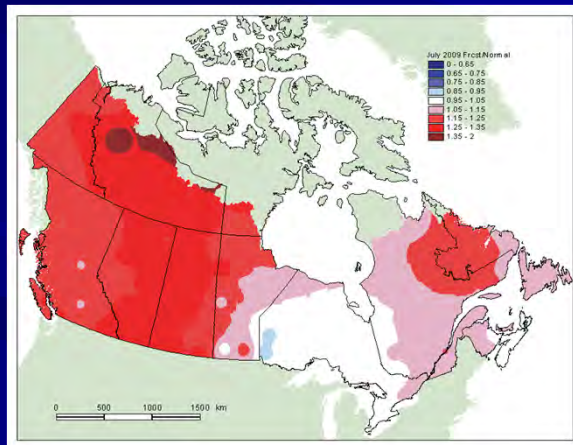

May

June

July

August

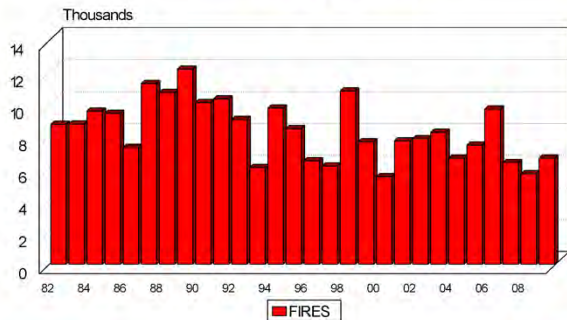

For 2009, monthly predictions indicated an above-average year for western Canada.

# 2009 Prediction

Again, another quiet fire season for most of Canada with only 846 000 ha burned.

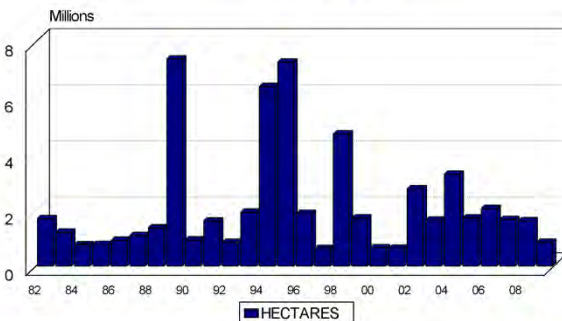

Fires by Year

6,636 fires

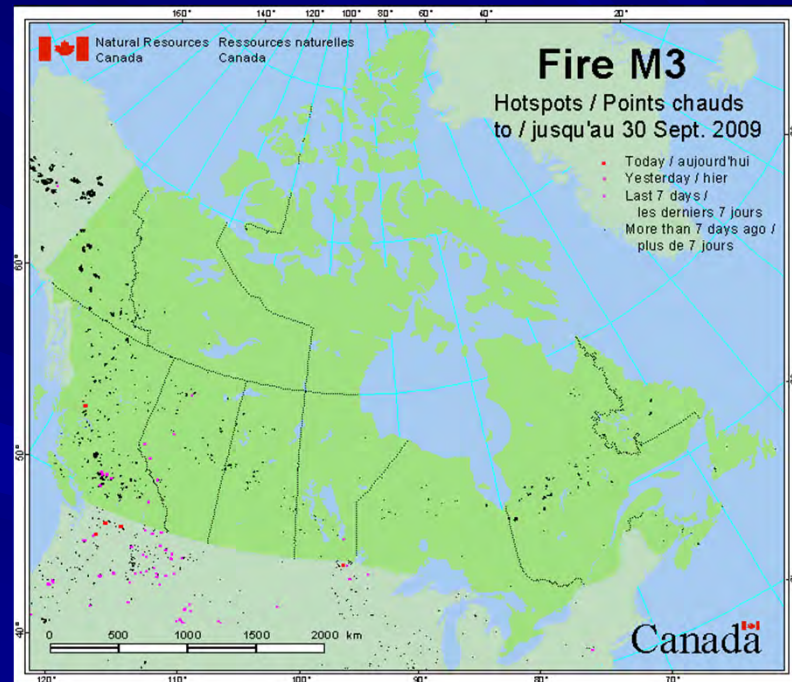

CIFFC

Hectares by Year

846,484 ha

CIFFC

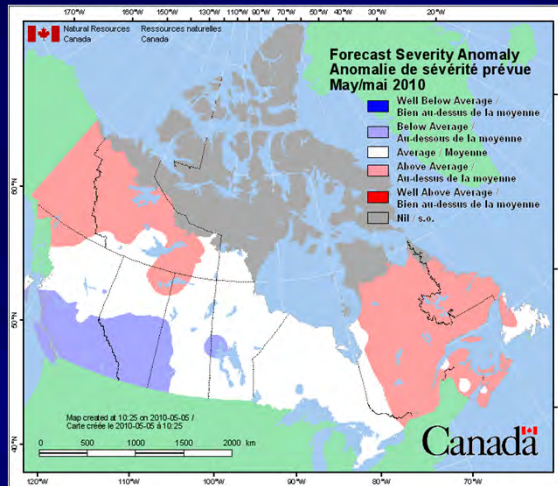

In August, an emergency situation developed in British Columbia burning over 229 000 ha (10 year average 75 000).

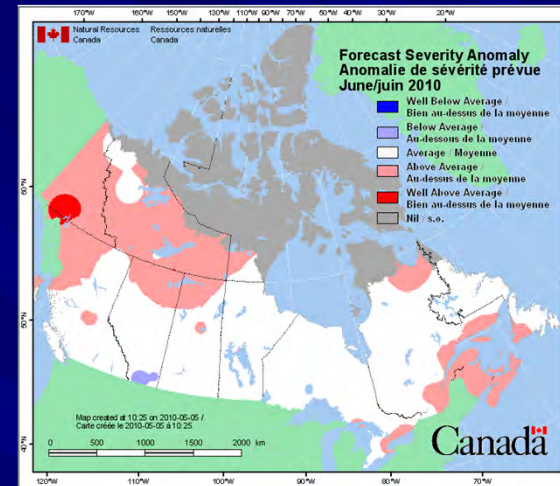

# 2010 Prediction

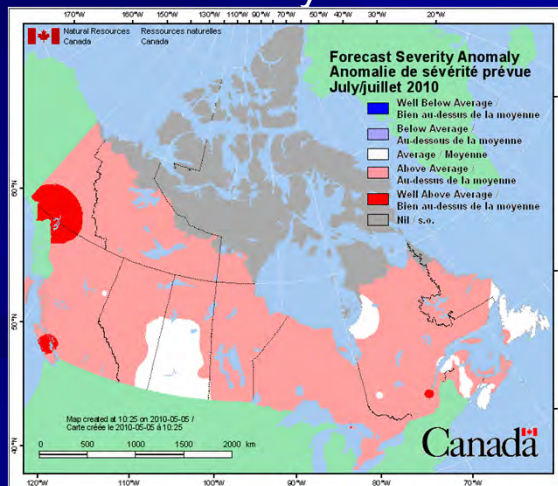

May

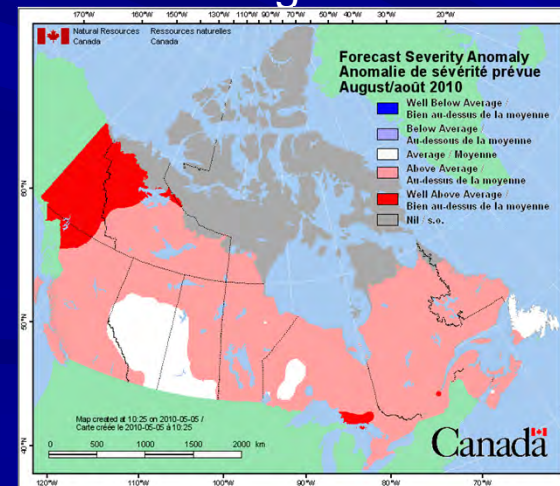

June

July

August

For 2010, monthly predictions indicated above-average spring conditions year in Quebec and an above-average summer for most of Canada.

# 2010 Prediction

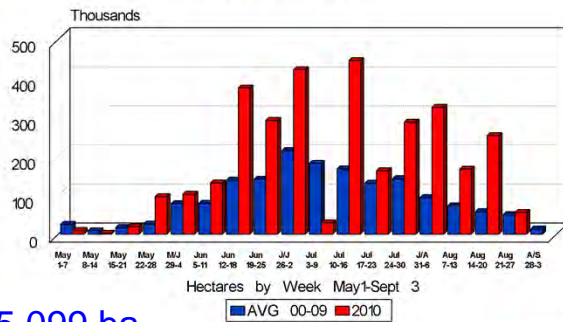

An above-average season with twice the average annual area burned.

**Fires**  
2010 vs 10 yr avg

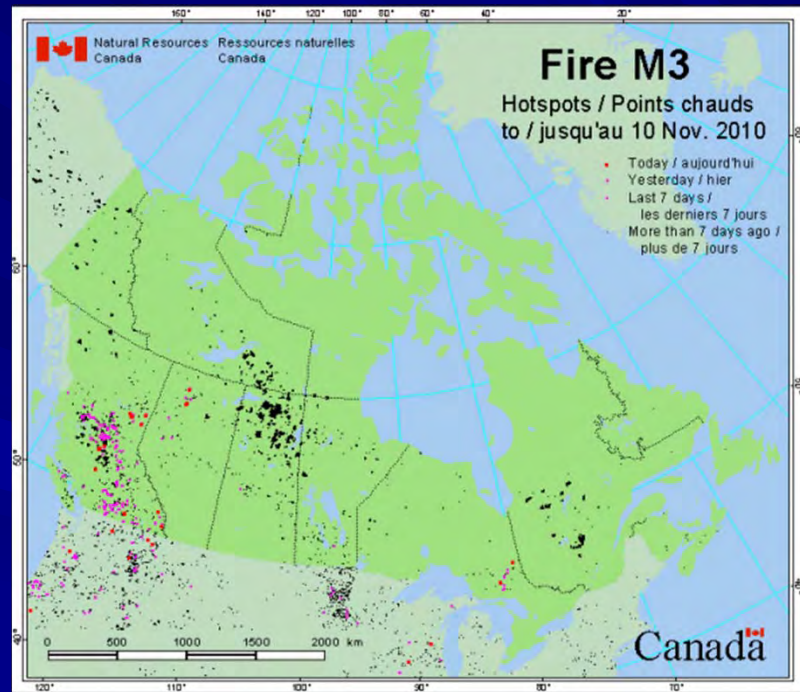

**7,319 fires**  
(avg: 7,389)

**Hectares**  
2010 vs. 10 YR AVG.

**3,155,099 ha**  
(avg 1,647,438 ha)

Most of the activity occurred in Quebec (May), Saskatchewan (July) and BC (August).

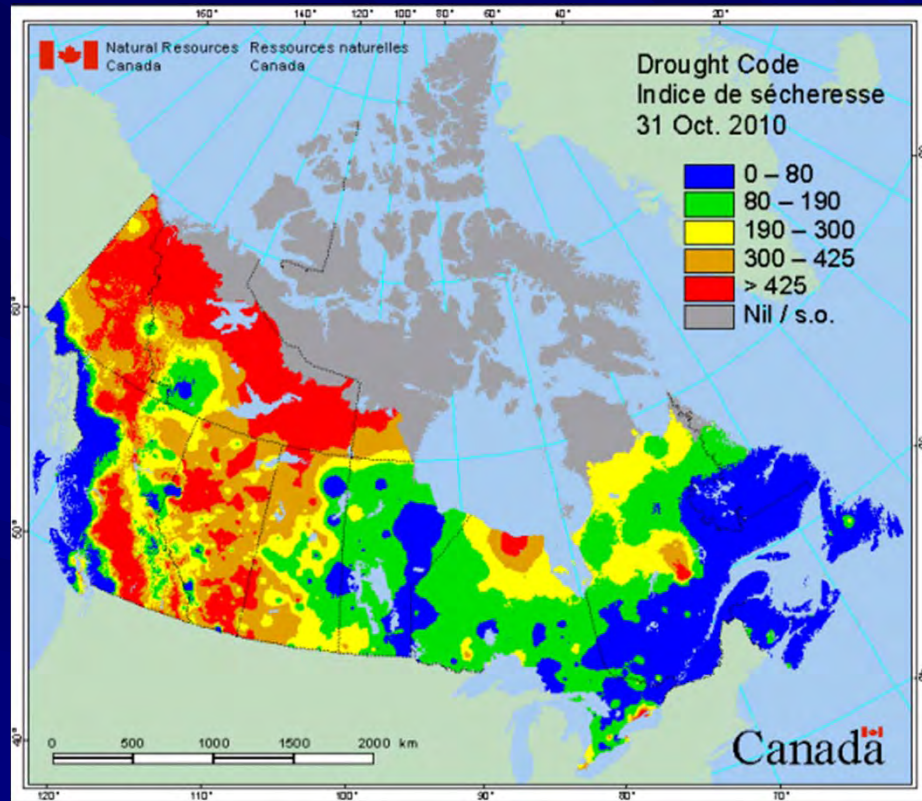

# 2011 Starting Conditions

# Spring Start-up Conditions

- The Canadian Forest Fire Weather Index (FWI) System allows for the carry-over of fall conditions to the spring.
- This is handled by the Drought Code (DC) (similar to the 1000 hour moisture code).
- All other moisture codes in the FWI system are reset.

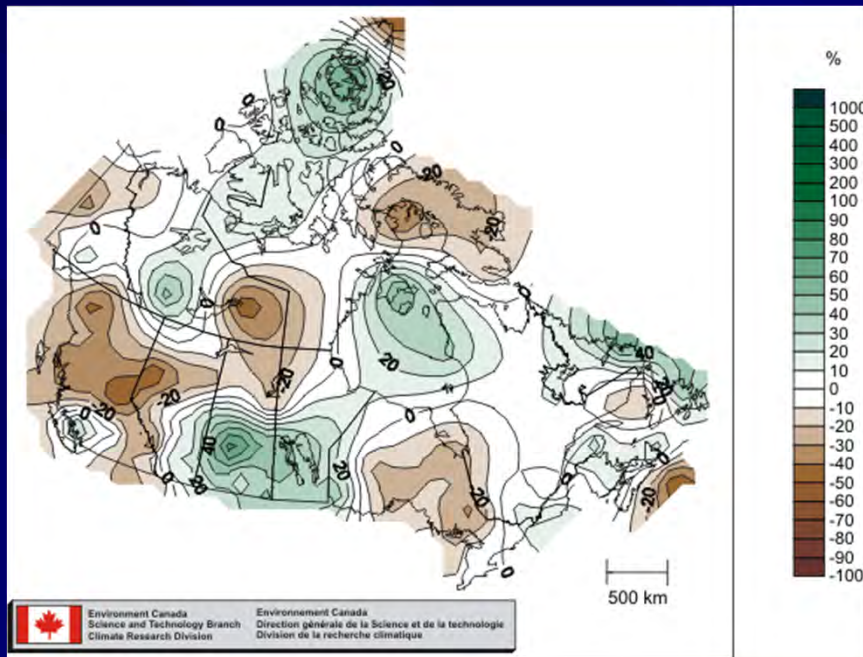

# Fall Conditions

Oct 31, 2010

Fall DC values show extreme (dry) conditions throughout much of Western Canada and the Territories.

# Precipitation Trends

The Prairies experienced its wettest year on record, 26.9% above normal.

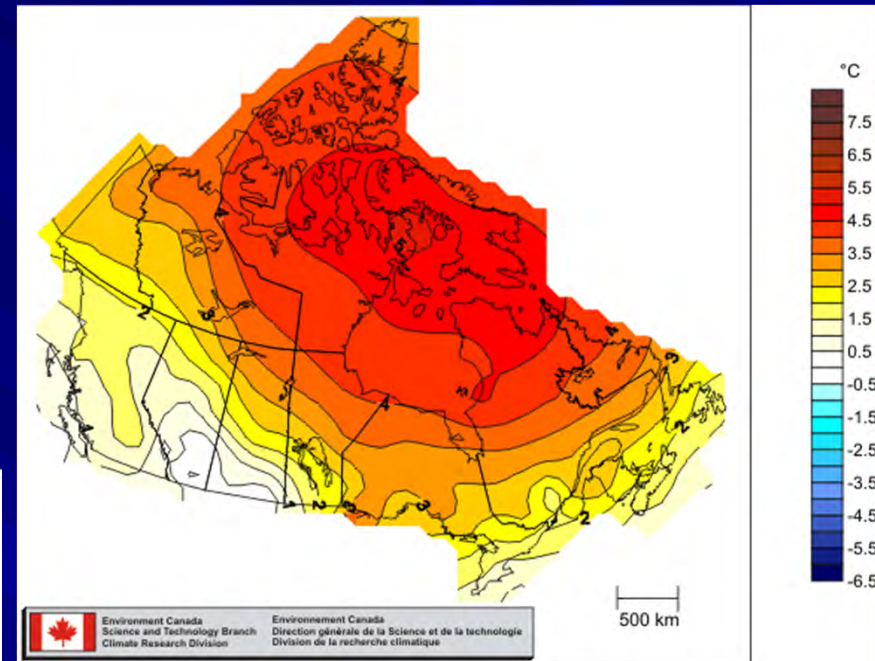

Canada experienced a normal precipitation year in 2010, 0.4% above normal.

# Temperature Trends

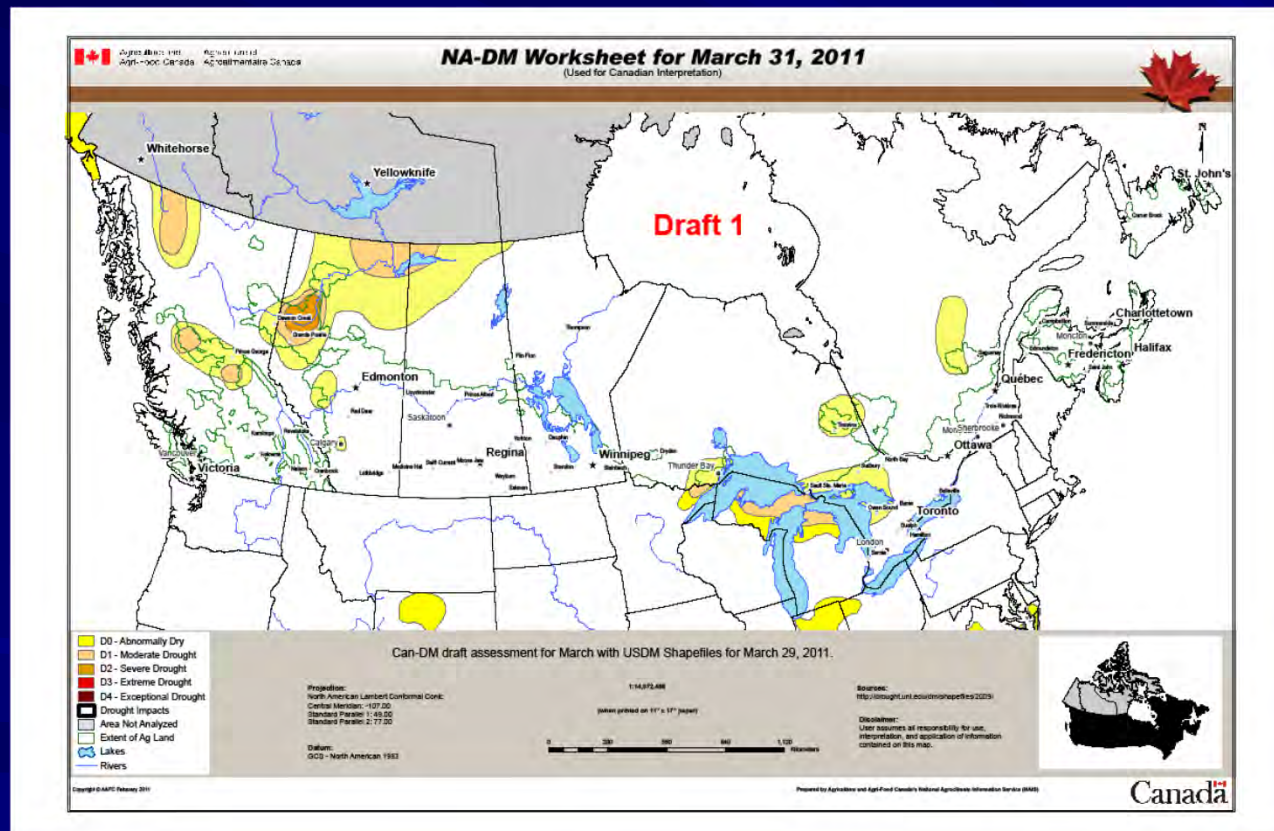

The national average temperature for the year 2010 was 3.0°C above normal.

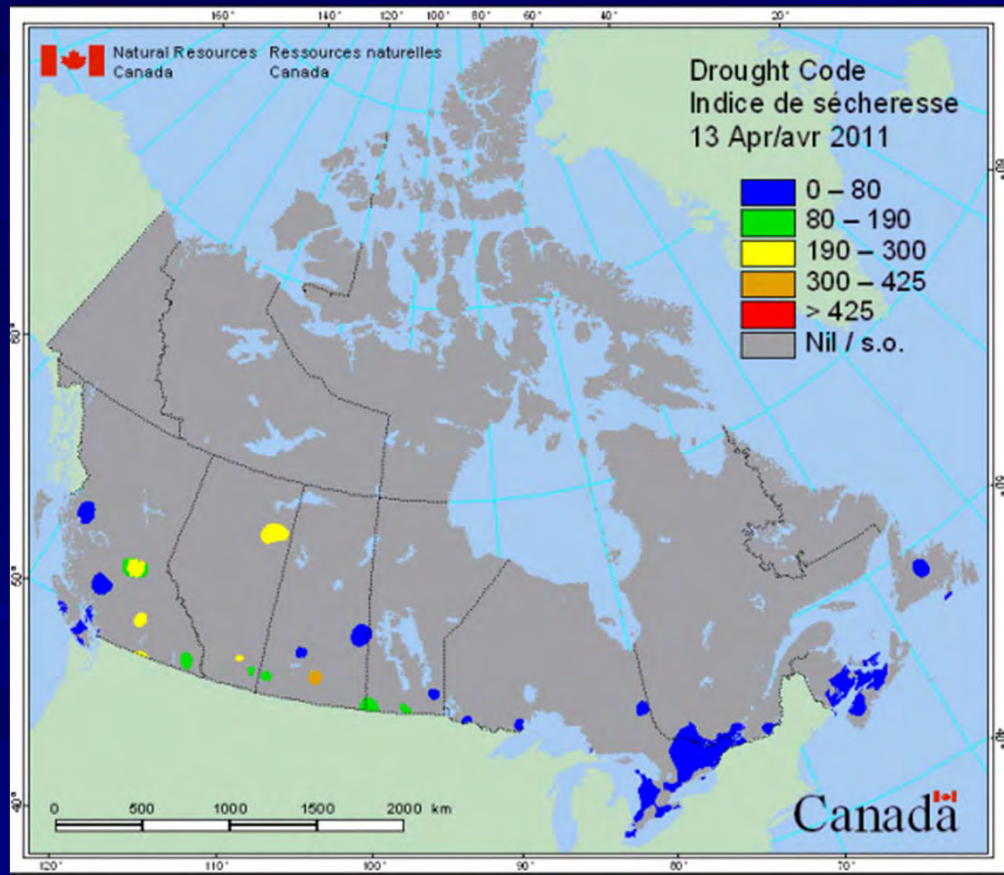

2010 was the warmest year on record since nationwide records began in 1948.

# Spring Start-up Conditions

Canadian Drought Monitor indicates a relatively normal pattern with parts of Alberta described as in severe drought

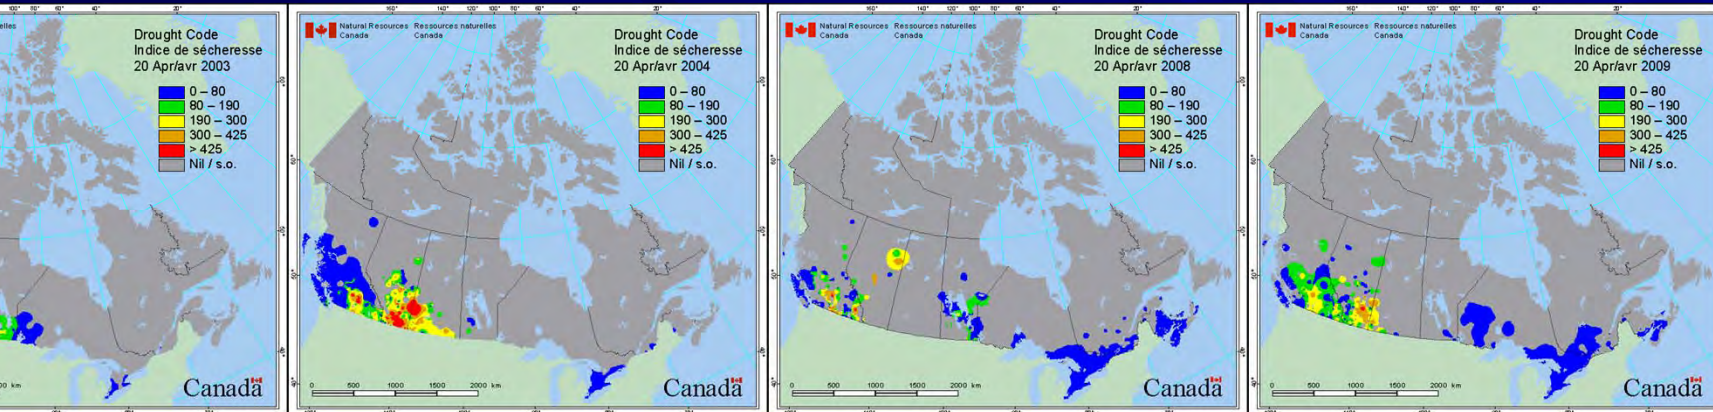

# Spring Start-up Conditions

Late spring prevents us from seeing the starting DC values, though it appears that Eastern Canada has had total recharge of deep fuel moistures, while Alberta and the interior of BC are high (corresponding to the Canadian Drought Monitor).

# Spring Start-up Conditions

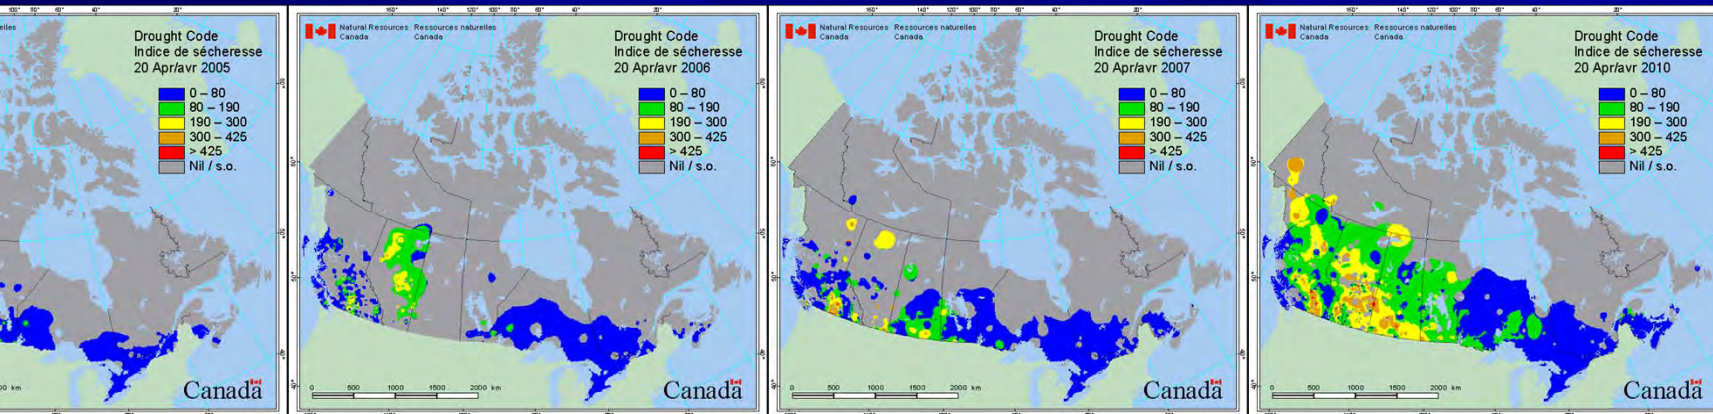

2003

2004

2005

2006

2007

2008

2009

2010

# Provincial Reports

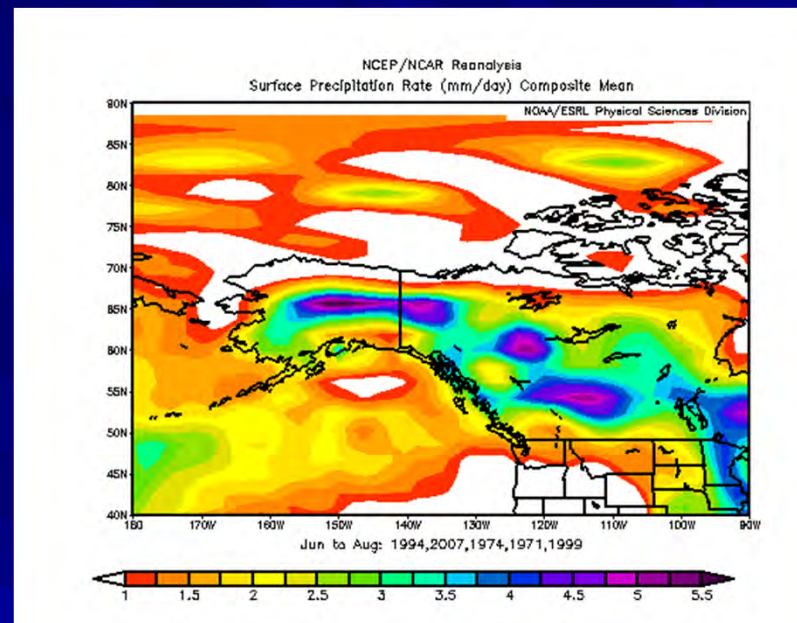

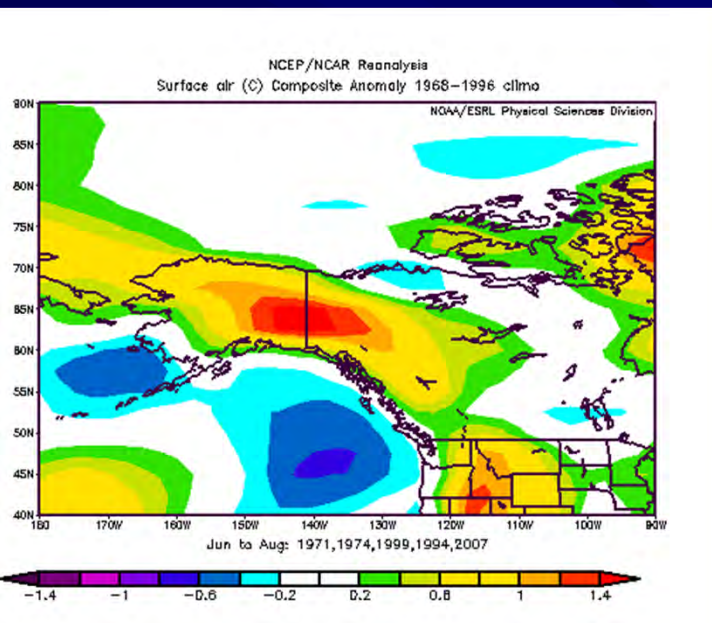

# Yukon

Normal snowpack conditions throughout much of the Territory with above-average in the southwest and below-average in the central Yukon.

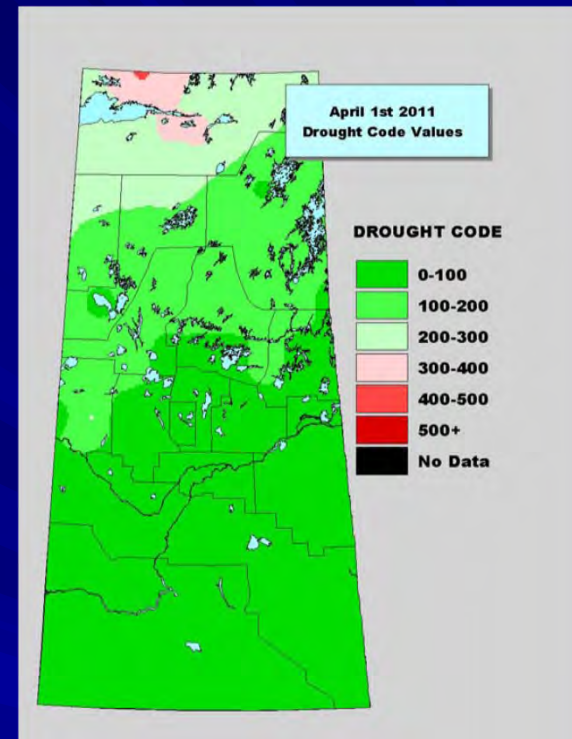

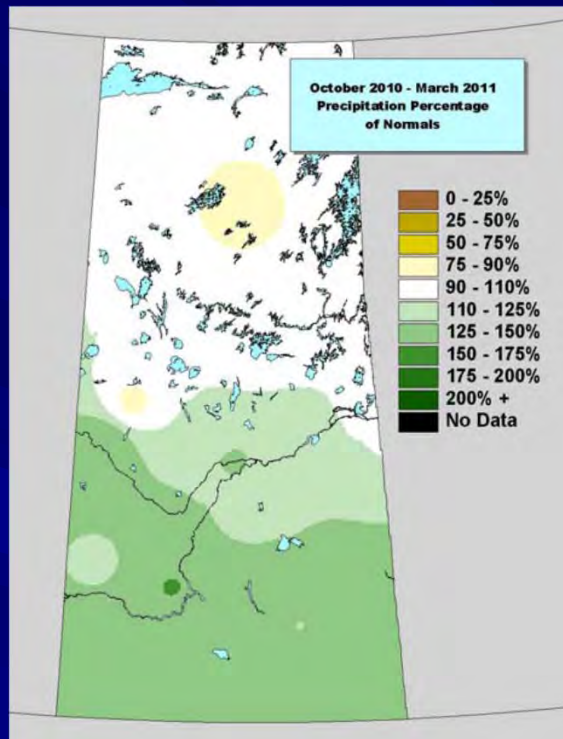

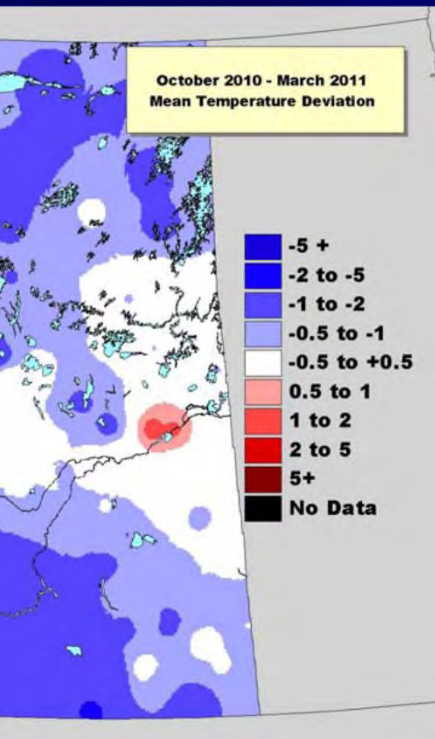

# Yukon

ISO pattern indicates conditions similar to 1971, 1974 and 1999.

This suggests warm conditions and high precipitation rates in central Yukon, pointing to an active lightning season.

# Saskatchewan

April 1st start-up DC indicates the Northwest may be an area of serious concern. Otherwise start-up values are low for the remaining regions. Green-up will probably occur by this spring even with a cooler spring regime.

# Ontario

	April	April, May, June	June, July August
<b>ENSO Effects</b>	<b>Cooler and Wetter</b>	<b>Slightly Cooler Becoming Drier</b>	<b>Diminishing Effects</b>
<b>NAO Effects</b>	<b>Cooler and Drier</b>	<b>Slightly Cooler and Drier</b>	<b>Diminishing Effects</b>

<b>Summary</b>	<b>Cooler and Slightly Wetter</b>	<b>Slightly Cooler and Becoming Drier</b>	<b>Likely Warmer and Drier</b>

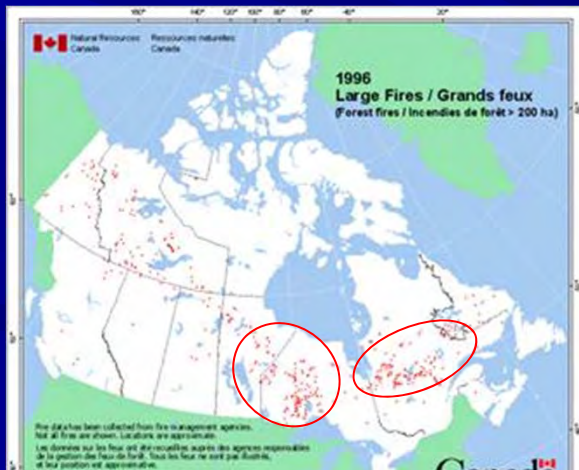

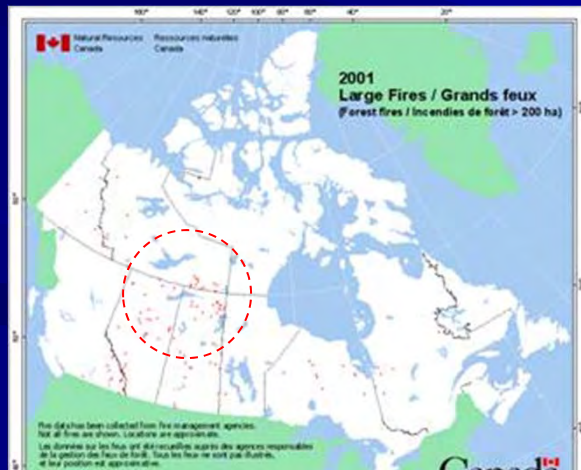

# Parks Canada

The Climate Prediction Center (NOAA) on ENSO status continues to forecast La Nina weakening and going neutral by June. A similar pattern preceded the following fire seasons – 2008, 2001, 2000(?), 1996, 1989, 1976.

The large fire database was considered for these years to predict what this year will bring.

Given recent persistence, maybe like 2008? Although with current conditions out west, not much will happen for a month or two.

# 2011 Seasonal Prediction

# Seasonal Forecasts

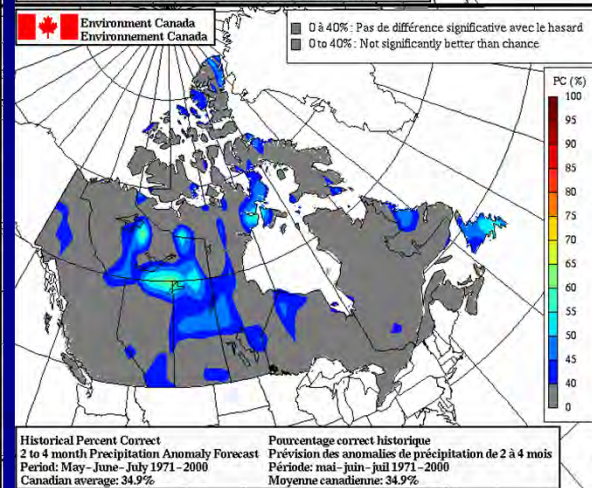

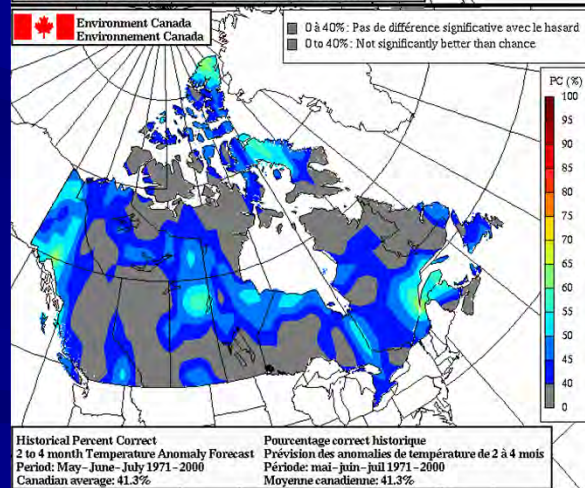

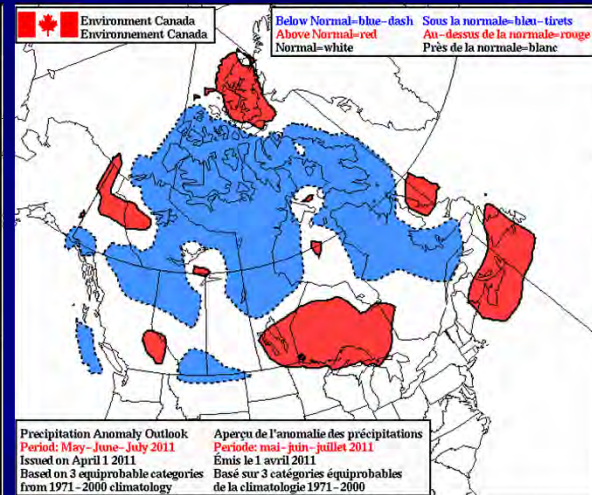

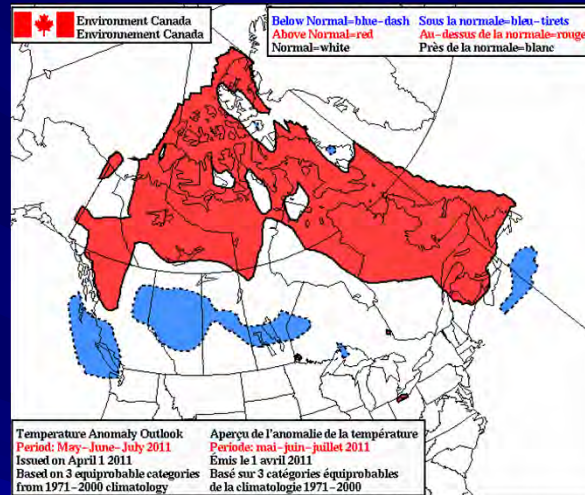

Spring temperature anomalies are low for much of Canada.

Precipitation anomalies are high for BC and eastern Canada and mixed for the west and north.

# Seasonal Forecasts

Early summer sees above-normal temperatures in western Canada and the Maritimes.

Below-normal precipitation is expected for the north above-normal in Ontario and the Maritimes.

# Seasonal Forecasts

Summer temperature anomalies are high for most of Canada.

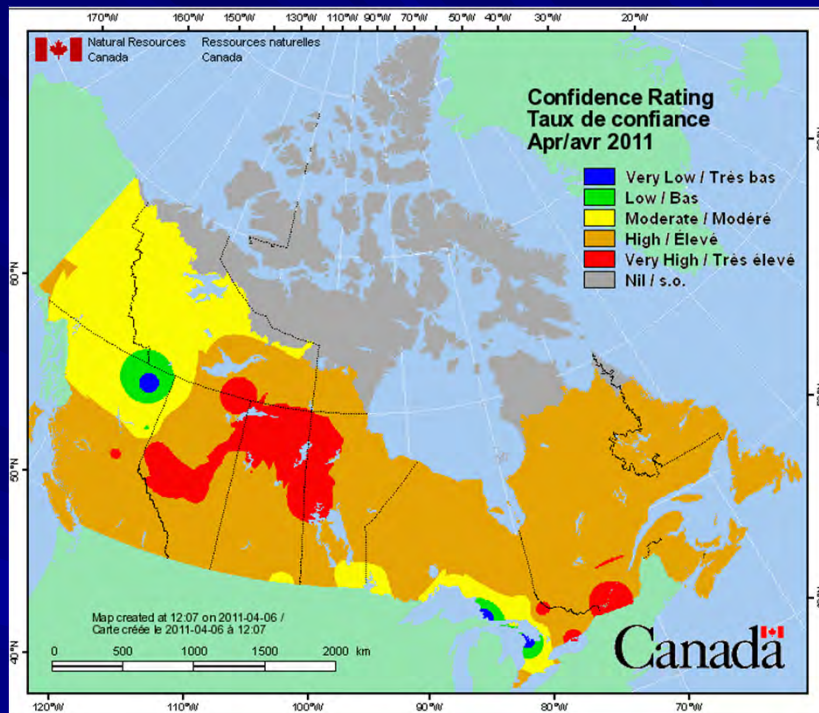

Below-normal precipitation is predicted for BC and the Hudson's Bay region, while above-normal precipitation is predicted for the remaining portions of Canada.

# April 2010

## Prediction

(forecast values normalized against average weather)

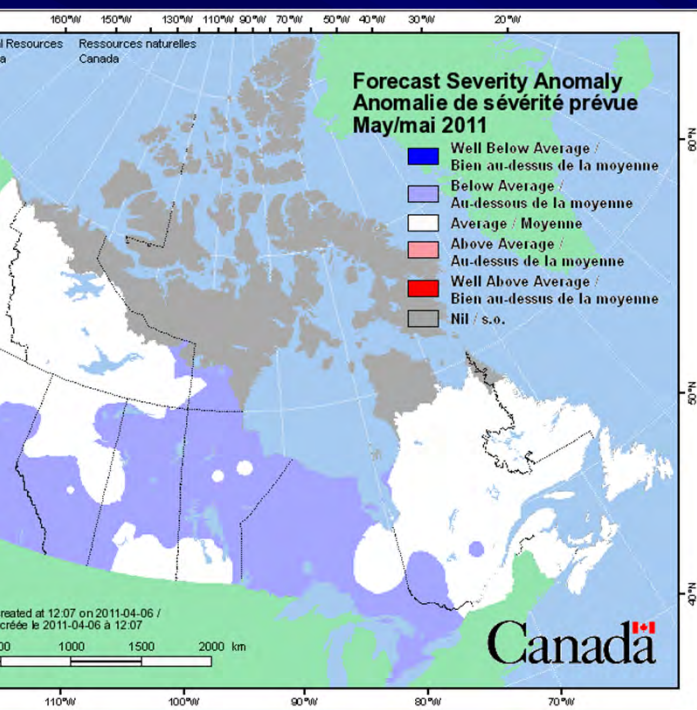

## Confidence

(standard deviation normalized against average weather)

Low conditions in western Canada and southern Ontario.  
High confidence in all but the northwest.

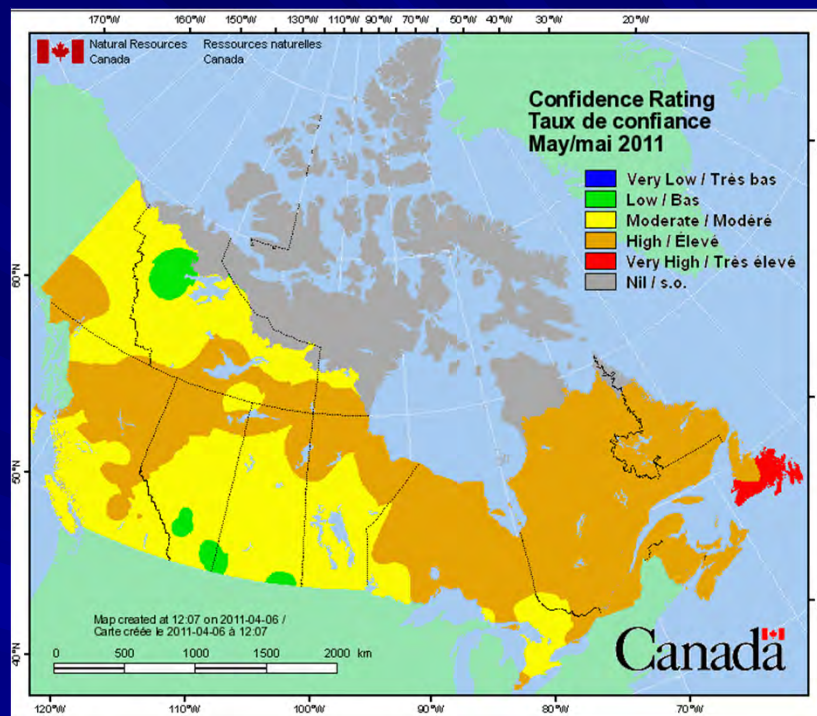

# May 2010

## Prediction

(normalized values against average weather)

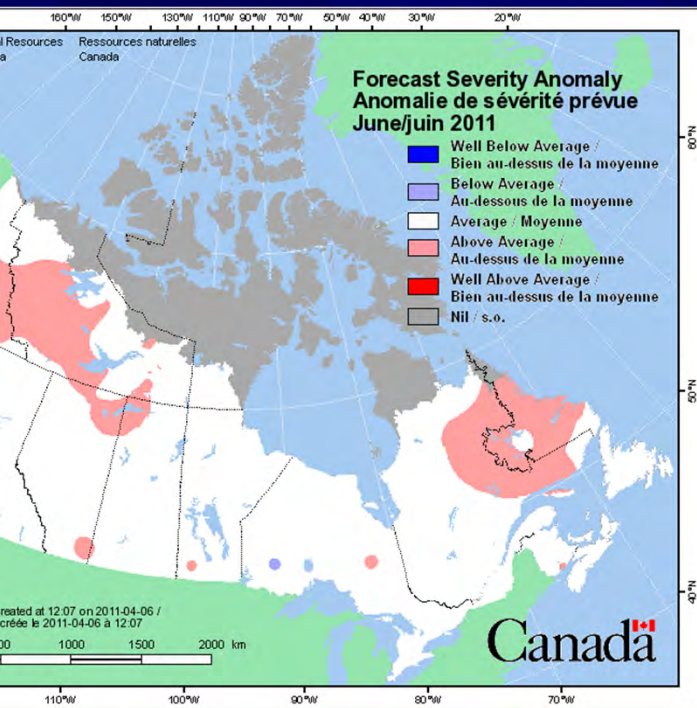

## Confidence

(standard deviation normalized against average weather)

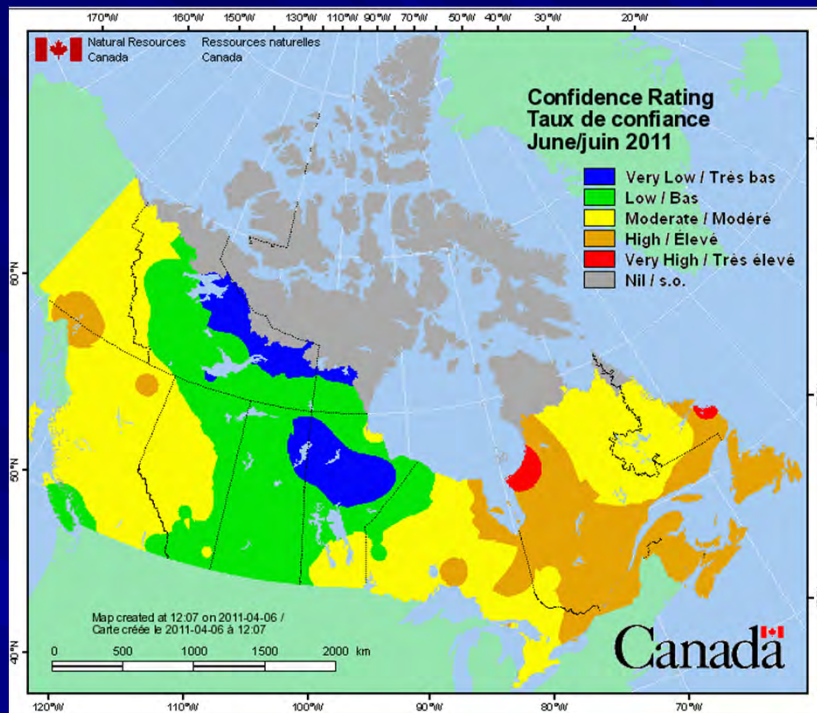

Below average condition continue in much of Western Canada, while fire weather conditions remain average in

# June 2010

## Prediction

(forecast values normalized against average weather)

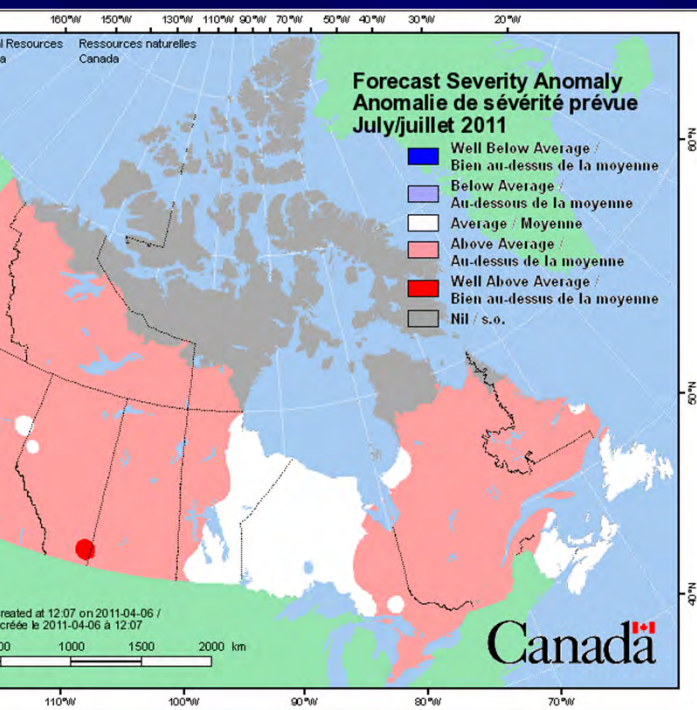

## Confidence

(standard deviation normalized against average weather)

The Yukon, NWT, northern Alberta and Quebec may see more activity. Confidence in the forecast drops in central

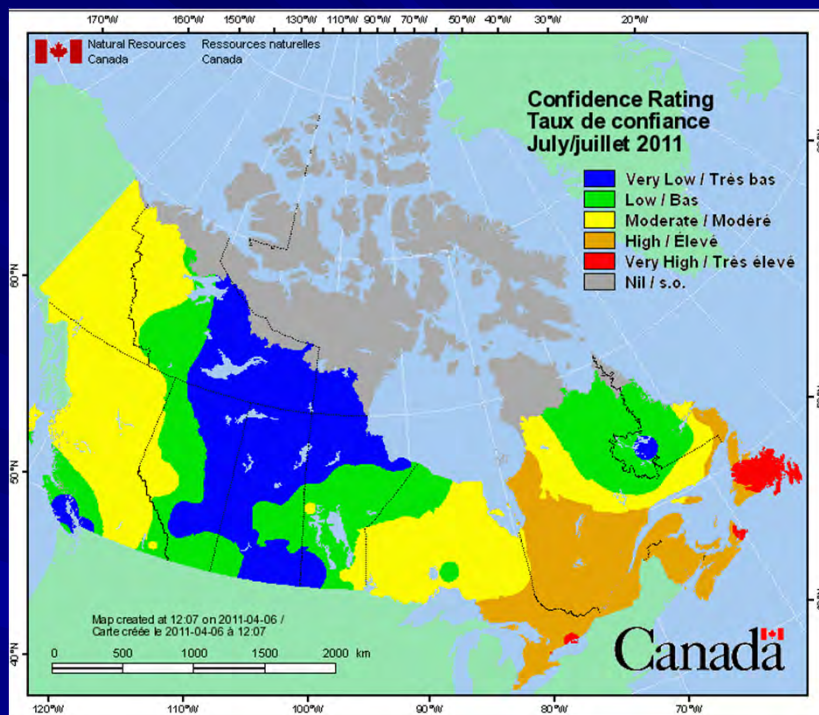

# July 2010

## Prediction

(standard deviation normalized against average weather)

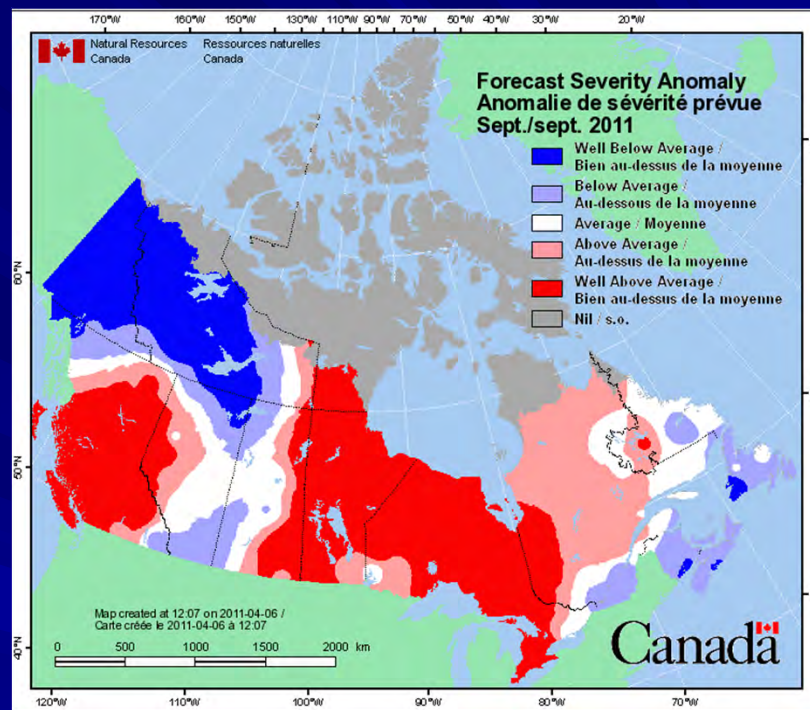

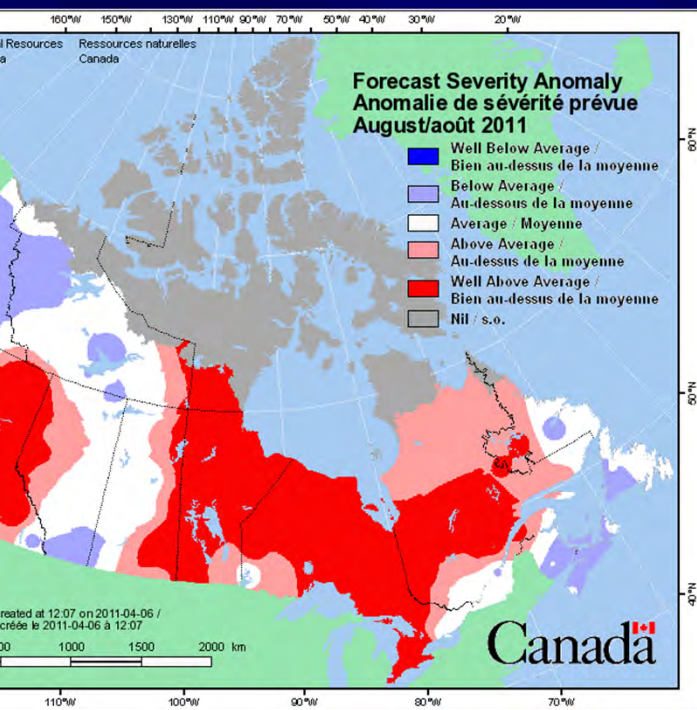

## Confidence

(standard deviation normalized against average weather)

...y sees a significant increase in fire weather conditions in western and eastern Canada. Low confidence in

# August, September 2010

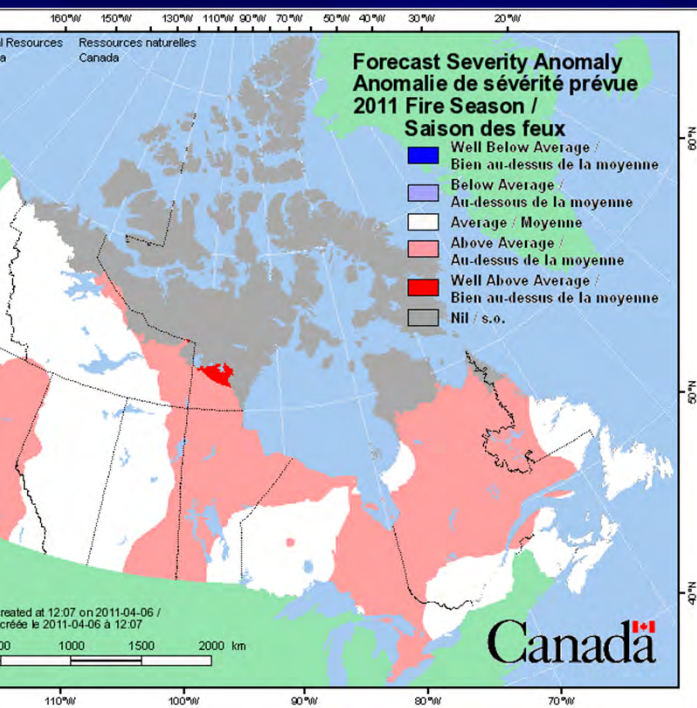

## Predictions

(predicted values normalized against average weather)

Predictions show high fire weather in BC and central Canada.  
Confidence in these extended forecasts are low.

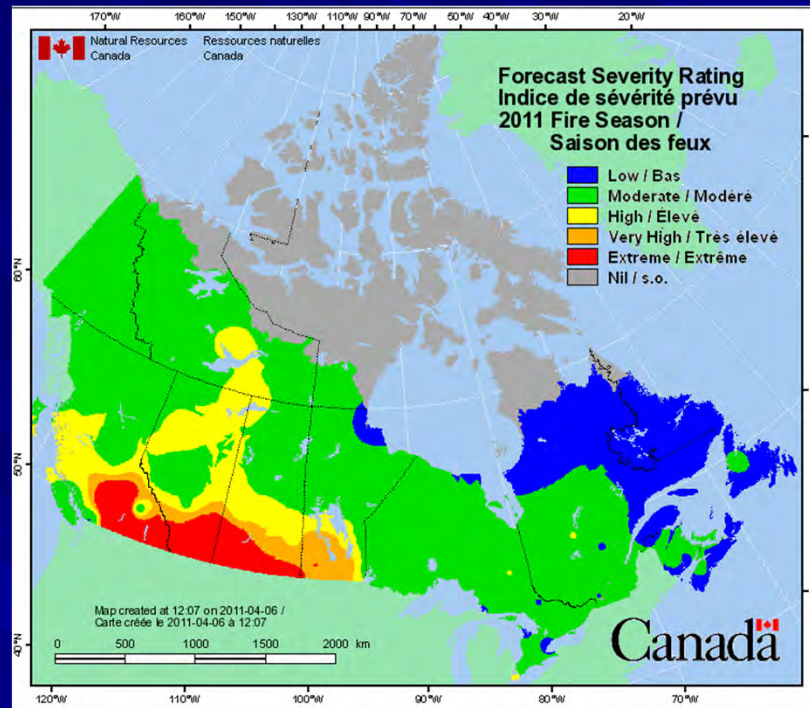

# May-Aug 2011

## Prediction

(normalized values against average weather)

## Confidence

(standard deviation normalized against average weather)

The 2011 fire season could be above-average for BC and eastern Canada. Confidence in the above-average region

The End

# ***Fire Danger Rating in Canada***

Kerry Anderson  
Canadian Forest Service

# Each Year in Canada

- 7,000 forest fires,
- 2 million hectares burned,
- Quarter of a billion dollars spent fighting fire.

# Forest Fires in Canada

## Fire cause

35% of fires are caused by lightning while 65% are caused by people.

87% of the area burned is from lightning-caused fires.

## Area burned

# Large Fire Occurrence in Canada

There is large annual variation in the fire numbers and area burned

with most fire activity occurring in the boreal forest.

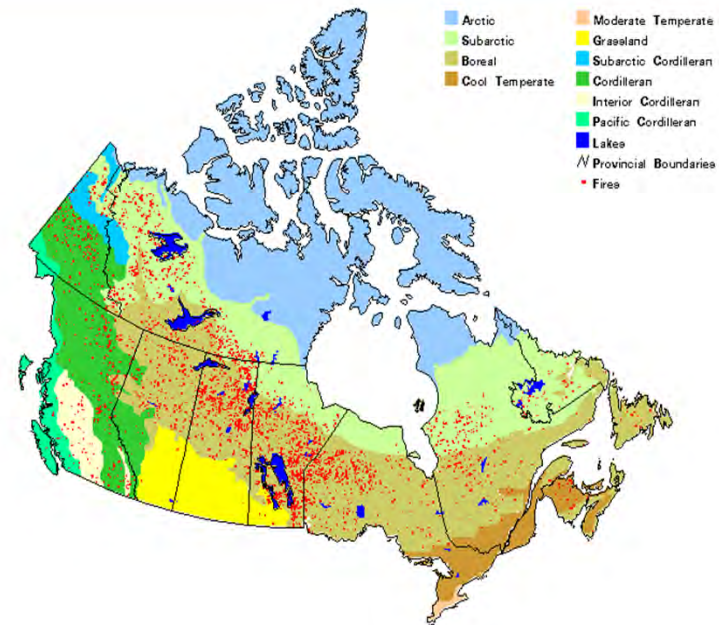

Figure1. Map illustrating the distribution of 1980-89 fires >200 hectares across Canadian Eco-climatic Provinces

# Social Trends

*From: Beshiri & Bollman 2001*

The rural metro-adjacent region is seeing the largest net increases in population. This corresponds to the **wildland-urban interphase**.

# Social Trends

Much of this new population consists of non-permanent residents as people buy recreational properties.

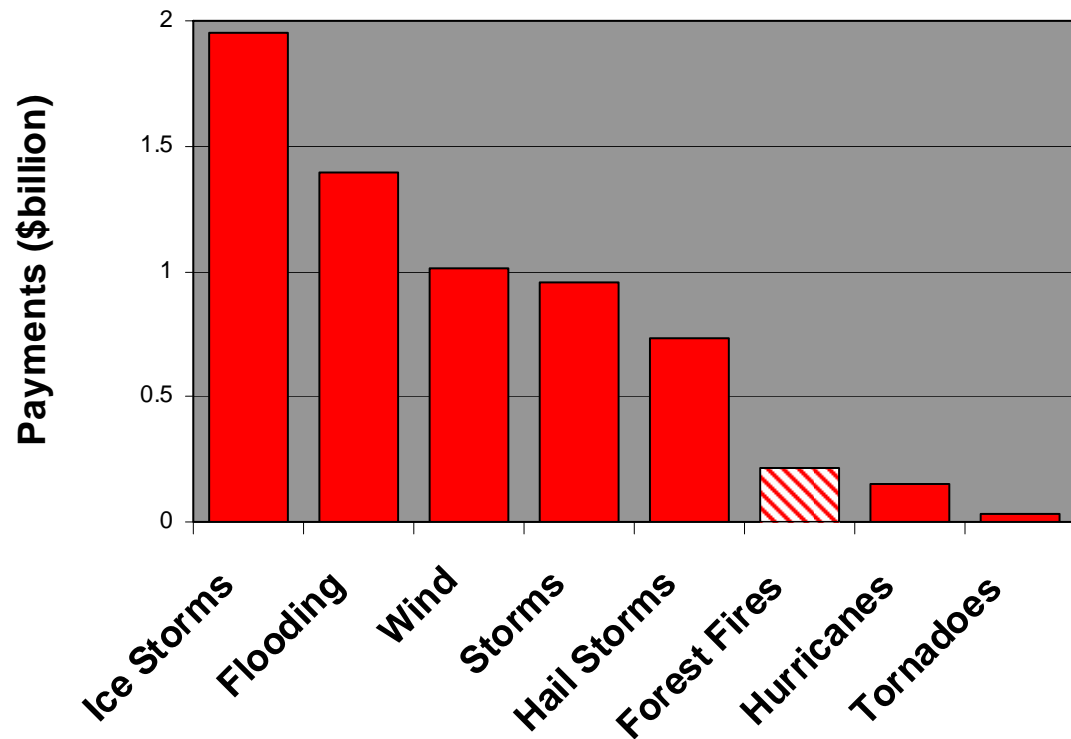

*Source: Town of Canmore 2006 Census*

# The Insurance Industry

Though insurance payouts are low compared to other categories, these may increase with social trends and climate change.

## Insurance Payouts 1992 - 2005

Source: Insurance Bureau of Canada 2006

# Fire is a Natural Part of the Landscape

Many coniferous tree species are fire dependent.

Fire opens the understorey to new seedlings and foraging animals.

Frequent fires prevent a build up of a dangerous flammable understorey.

# The Dilemma

*How do we balance the ecological benefits with the loss of valuable timber and the threat to human habitation?*

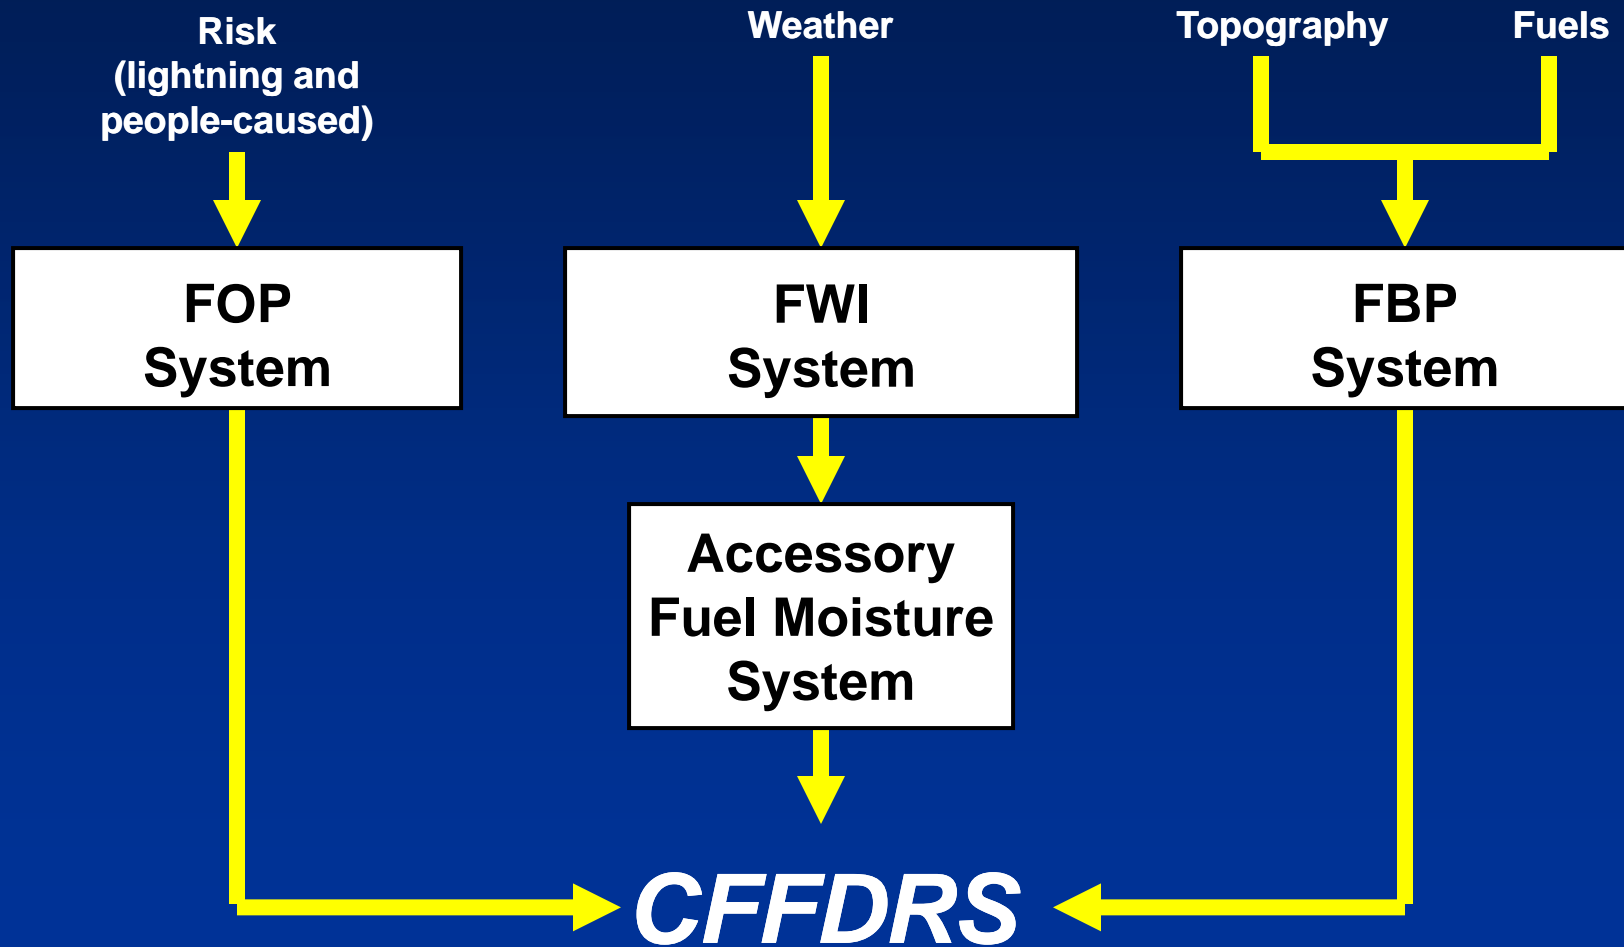

# The Canadian Forest Fire Danger Rating System

The CFS has developed the **CFFDRS** to predict fire danger in Canada.

# The Canadian Forest Fire Danger Rating System

# Canadian Forest Fire Weather Index (FWI) system

The **FWI** system was developed thirty years ago by the CFS

Based upon noon weather readings, the system predicts:

- *Fuel moisture at three depths*
- *Potential fire behaviour.*

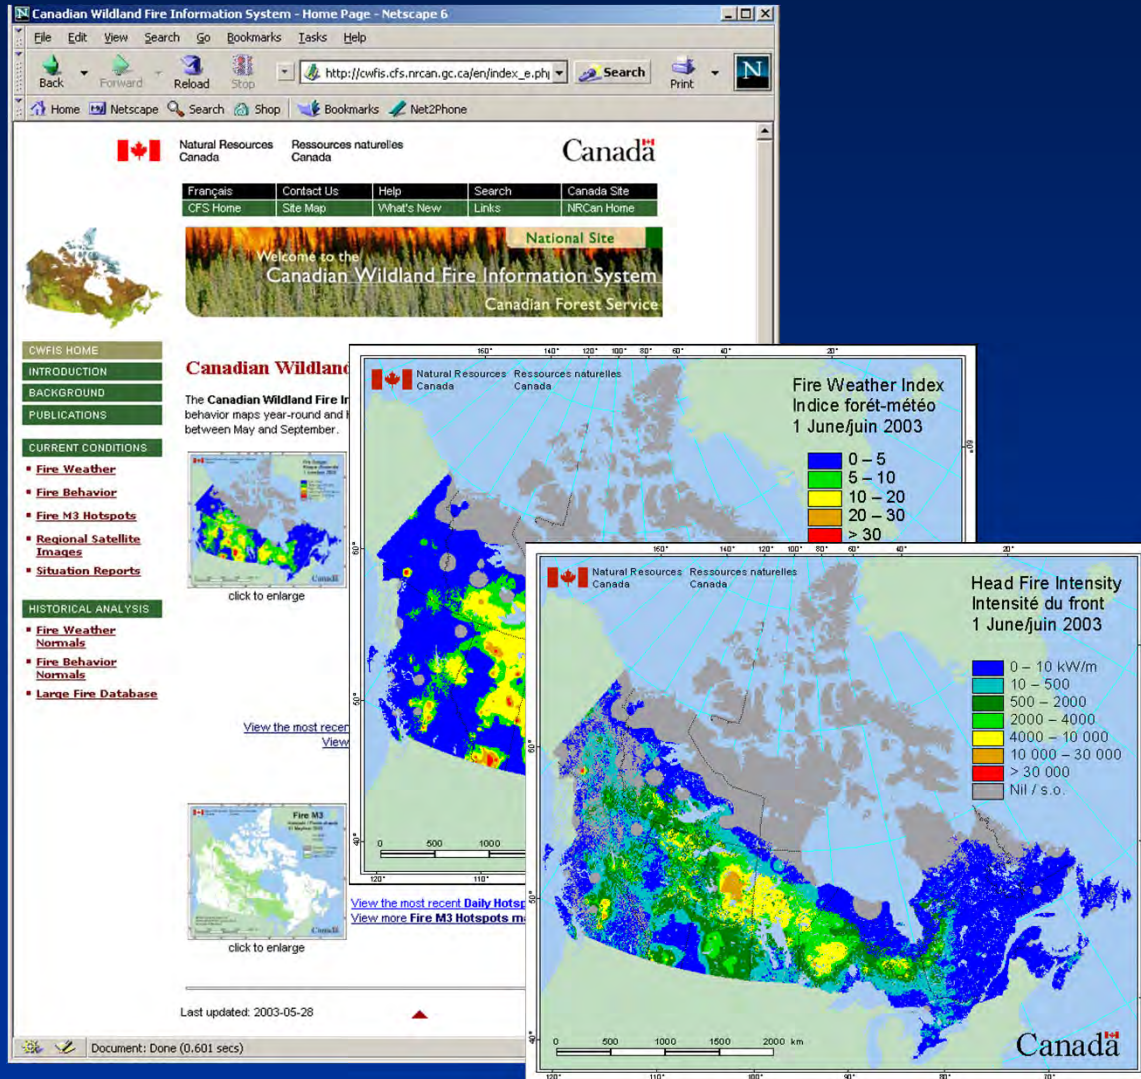

# Canadian Forest Fire Behavior Prediction (FBP) system

The **FBP** system was developed over the last twenty years.

Based upon empirical studies, the system predicts physical fire parameters in a variety of fuel types.

# Canadian Wildland Fire Information System

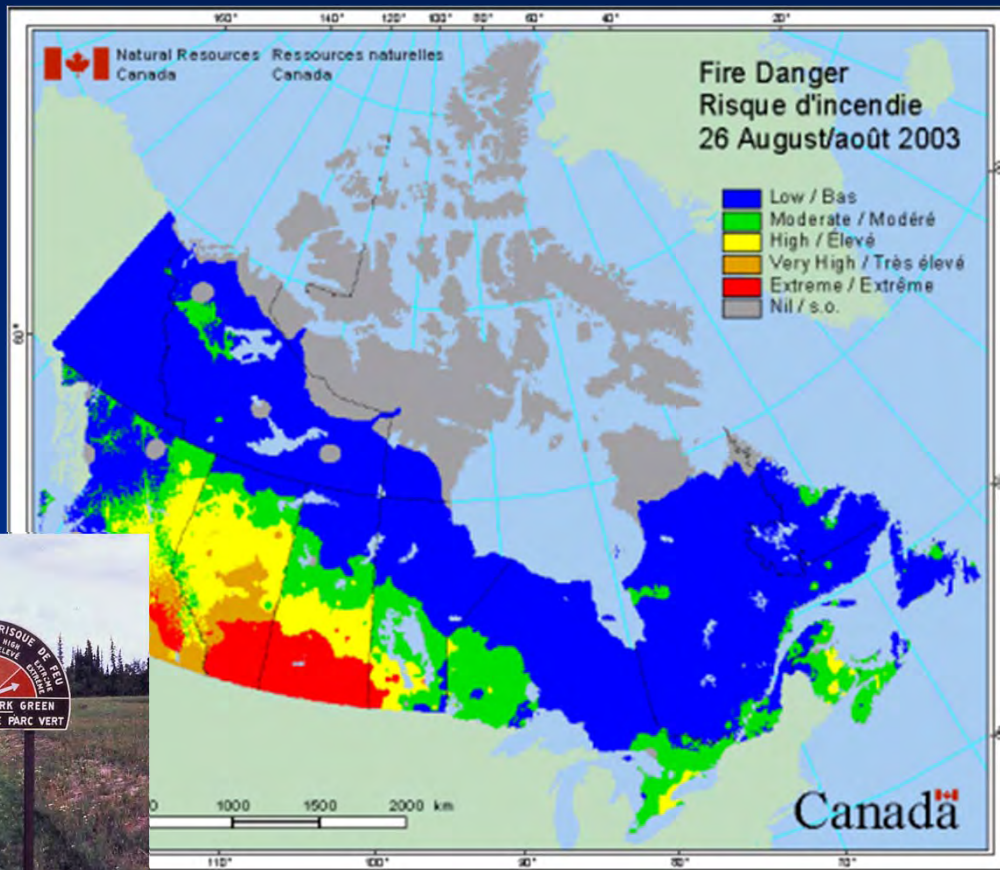

The Canadian Wildland Fire Information System calculates the fire weather and fire behaviour conditions across the country.

Maps are displayed over the Internet.

# Fire Weather

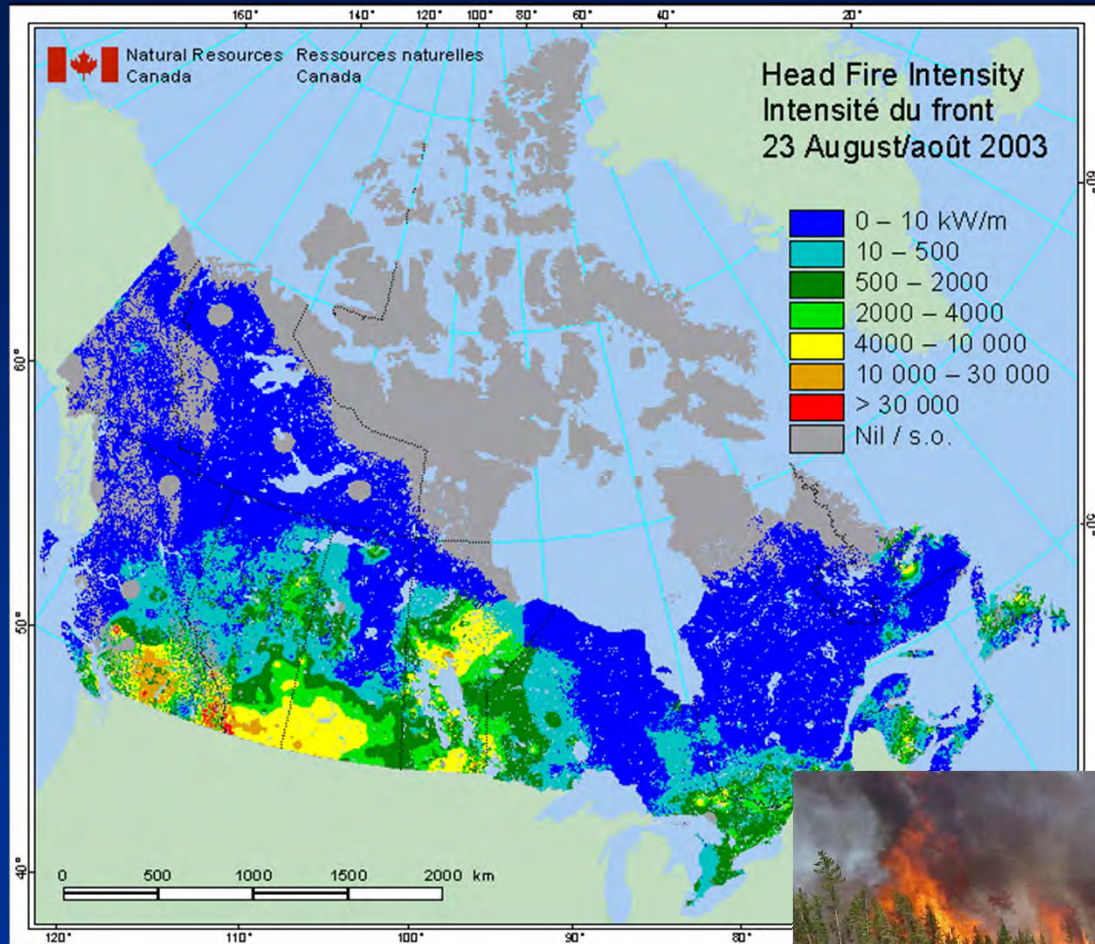

Weather observations are interpolated and then used as inputs for the **FWI** system to produce fire danger maps.

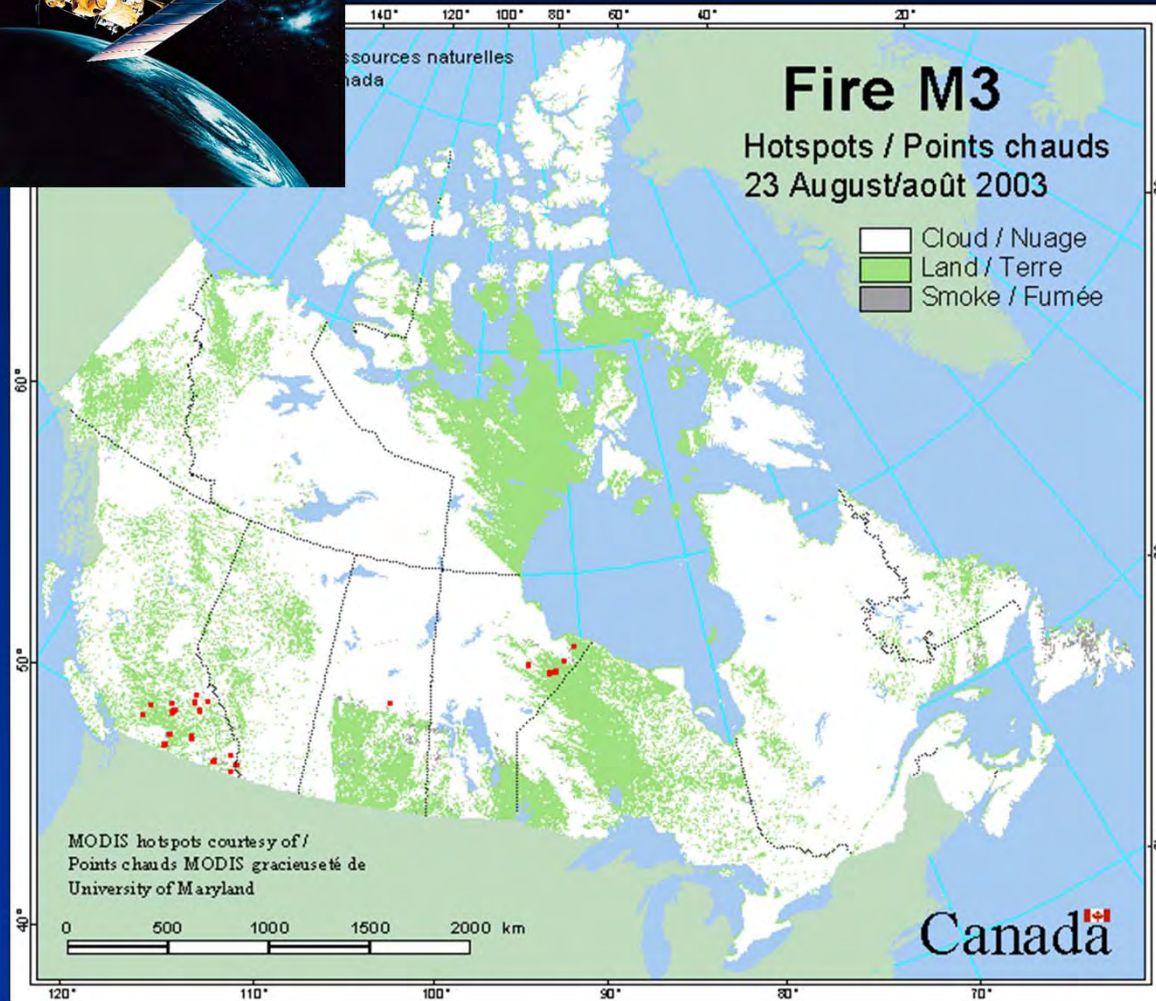

# Fire Behaviour

Using the **FBP** system, potential fire behaviour maps are produced based on fuels, topography and weather.

# Hotspots

Large fires are detected and mapped using NOAA/AVHRR and MODIS satellite imagery in near real time.

# *Summary*

# Summary

The **Canadian Forest Fire Danger Rating System** is a national system that has been used successfully in Canada for over forty years.

The **Canadian Wildland Fire Information System** presents the current national fire situation to fire suppression agencies and to the general public.
